VOSH PROGRAM DIRECTIVE: 12-260  

Subject: Walking-Working Surfaces and Personal Protective Equipment (Fall Protection Systems), Final Rule; and Other Related Provisions

Purpose: This directive transmits to field personnel the above-referenced standard.

This Program Directive is an internal guideline, not a statutory or regulatory rule, and is intended to provide instructions to VOSH personnel regarding internal operation of the Virginia Occupational Safety and Health Program and is solely for the benefit of the program. This document is not subject to the Virginia Register Act or the Administrative Process Act; it does not have general application and is not being enforced as having the force of law.

Scope: This Directive applies VOSH-wide.

Reference: 81 FR 82494 (18 November 2016)

Cancellation: Not Applicable

Effective Date: 15 May 2017

Expiration Date: Not Applicable

Action: Directors and Managers shall ensure that field personnel understand the standard in this Directive.

C. Ray Davenport  
Commissioner

Distribution:  
Commissioner of Labor and Industry  
Assistant Commissioner  
VOSH Directors and Managers  
VOSH Legal Support & IMIS Staffs  
Director of Cooperative Programs  
VOSH Compliance & Cooperative Programs Staffs  
OSHA Region III & OSHA Norfolk Area Offices
When the guidelines, as set forth in this Program Directive, are applied to the Commissioner of the Department of Labor and Industry and/or to Virginia employers, the following federal terms if, and where they are used, shall be considered to read as below:

I. **Background**

In 1971, OSHA adopted its initial general industry standards on Walking-Working Surfaces (Part 1910, Subpart D) and Personal Protective Equipment (PPE) (Part 1910, Subpart I) from national consensus standards in existence at the time and, subsequently, adopted as occupational safety and health standards any established federal and national consensus standards. Those national consensus standards have been updated and revised over time to incorporate advancements in technology and industry best practices. OSHA’s existing walking-working surfaces standards, however, have not kept pace with those advancements.

OSHA’s efforts to revise and update the existing walking-working surfaces standards have been ongoing since 1973. OSHA first issued a notice of proposed rulemaking on the rule in 1990, followed by a second notice in 2010. As a result, OSHA has gathered and analyzed a large body of data and information on walking-working surface hazards and methods to prevent and eliminate them.

II. **Summary**

A. **General**

The revised final rule updates the requirements in all of the general industry walking-working surfaces, including but not limited to, floors, ladders, stairways, runways, dockboards, roofs, scaffolds, and elevated work surfaces and walkways, as well as fall and falling object protection. It adds new requirements on the design, performance, and use of personal fall protection systems in Part 1910, Subpart I-Personal Protective Equipment.

It also includes changes to provisions in Subparts F-Powered Platforms, Manlifts, and Vehicle-Mounted Work Platforms, N-Materials Handling and Storage, and R-Special Industries of Part 1910. OSHA drew many of the revisions, new provisions, and technological advancements in the amended final rules from various national consensus standards. Primarily, the changes are technical in nature and are necessary so all sections in Part 1910 conform to final Subparts D-Walking-Working Surfaces and I-Personal Protective Equipment.

OSHA has permitted the use of personal fall protection systems in construction since 1994 and the new rule adopts similar requirements for general industry. The revised final rule includes a number of revisions to existing general industry standards. A summary of some of the changes and new requirements includes:

- **Inspection of walking-working surfaces (§1910.22(d))** - requires that employers inspect walking-working surfaces regularly and as needed and correct, repair, or guard against hazardous conditions.

- **Updated scaffold requirements (§1910.27(a))** - replaces the outdated general industry scaffold standards with the requirement that general industry employers comply with OSHA’s construction scaffold standards.
- **Rope descent systems (RDS) and certification of anchorages (§1910.27(b))** - defines RDS as a suspension system that allows a worker to descend in a controlled manner and, as needed, stop at any point doing the descent to perform work. An RDS usually consists of a roof anchorage, support rope, descent device, carabiners or shackles, and a chair (seat board). The revised final rule codifies OSHA’s memorandum for employers who use RDS to perform elevated work. It prohibits employers from using RDS at heights greater than 300 feet above lower level unless they demonstrate it is not feasible or creates a greater hazard to use any other system above that height.

- **Phase-in of ladder safety systems or personal fall arrest systems on fixed ladders (§1910.28(b)(9))** - phases-in over 20 years a requirement to equip fixed ladders that extend over 24 feet with ladder safety or personal fall arrest systems and prohibits the use of cages and wells as a means of fall protection after the phase-in deadline. There is wide recognition that cages and wells do not prevent workers from falling from fixed ladders or protect them from injury if a fall occurs.

- **Fall protection flexibility (§1910.28(b))** - allows employers to protect workers from falls by choosing from a range of accepted fall protection systems, including personal fall protection systems. It eliminates the existing mandate to use guardrails as the primary fall protection method and gives employers the flexibility to determine what method they believe will work best in their particular workplace situation. This is deemed the most significant update.

- **Phase-out of the “qualified climber” exception in outdoor advertising (§1910.28(b)(10))** - phases out OSHA’s directive allowing qualified climbers in outdoor advertising to climb fixed ladders on billboards without fall protection and phases in the requirements to equip fixed ladders over 24 feet with ladder safety or personal fall arrest systems. Outdoor advertising employers must follow the fall protection phase-in timeline for fixed ladders. However, if ladders do not have any fall protection, outdoor advertising employers have two years to comply with the existing standard, i.e., install a cage or well or, instead, they may install a ladder safety or personal fall arrest system, both of which are cheaper than cages or wells.

- **Training (§1910.30)** - adds requirements that employers ensure workers who use personal fall protection and work in other specified high hazard situations are trained and retrained, as necessary, about fall and equipment hazards, including fall protection systems. **Employers must provide information and training to each worker in a manner the worker understands.**

- **Personal fall protection system performance and use requirements (§1910.140)** - adds requirements on the performance, inspection, use, and maintenance of these systems, and **prohibits the use of body belts a part of a personal fall arrest system.**
B. **Applicability**

This revised final rule does not change construction or agricultural standards. Also, excluded from coverage by the revised standard are employee tasks on surfaces that fall outside of OSHA’s jurisdiction due to location or operational status, or those tasks that are subject to unique industry-specific fall protection requirements addressed elsewhere in Part 1910, including §1910.268, Telecommunications, and §1910.269, Electric Power Generation, Transmission, and Distribution.

C. **Nature of the Risk**

Workers in many diverse general industry workplaces are exposed to walking-working surface hazards that can result in slips, trips, or falls that may cause injuries or fatalities. These walking-working surface hazards result in worker fatalities and serious injuries, including lost-workday injuries. Slips, trips, and falls, including falls on the same level, can result in injuries such as fractures, contusions, lacerations, and sprains, and may even be fatal. Falls to lower levels can increase the severity of injuries as well as the likelihood of death. Falls on the same level can also result in strains and sprains when employees try to “catch” themselves to prevent falling.

According to the Bureau of Labor Statistics (BLS) data, slips, trips, and falls are a leading cause of workplace fatalities and injuries in general industry, which indicates that workers regularly encounter these hazards. Nationally, from 1999 to 2010, falls were second only to highway incidents in terms of fatal injuries. In 2011, slips, trips, and falls were the third leading cause of fatal occupational injuries and in 2012, approximately one-third of all fatal falls in private industry were falls to a lower level in general industry.

There are many walking-working surface hazards that can cause a fatality or serious injury, including:

- damaged or worn components on personal fall protection systems and rope descent systems;
- portable ladders used for purposes for which they were not designed;
- fixed ladders that are not equipped with fall protection;
- damaged stair treads;
- snow, ice, water, or grease on walking-working surfaces such as floors; and
- dockboards that are not properly secured or anchored.
### III. Implementation/Compliance Schedule

Most of the final rule will become effective in VOSH on May 15, 2017, but some provisions have delayed effective dates. The following table specifies the amount of additional time OSHA is giving employers to certify anchorages, equip fixed ladders with fall protection, and train workers:

<table>

PART 1910—OCCUPATIONAL SAFETY AND HEALTH STANDARDS

§ 1910.25 Stairways.

§ 1910.26 Dockboards.

§ 1910.27 Scaffolds and rope descent systems.

§ 1910.28 Duty to have fall protection and falling object protection.

§ 1910.29 Fall protection systems and falling object protection—criteria and practices.

§ 1910.30 Training requirements.

Authority: 29 U.S.C. 653, 655, and 657; Secretary of Labor's Order No. 12-71 (36 FR 38754), 8-76 (41 FR 25950), 9-83 (48 FR 35726), 1-90 (55 FR 9923); and 1-2012 (77 FR 47316), as applicable; and 29 CFR part 1911.

§ 1910.21 Scope and definitions.

(a) Scope. This subpart applies to all general industry workplaces. It covers all walking-working surfaces unless specifically excluded by an individual section of this subpart.

(b) Definitions. The following definitions apply in this subpart.

Alternate tread type stair means a type of stairway consisting of a series of treads that usually are attached to a center support in an alternating manner such that an employee falling from an elevation does not have both feet on the same level while using the stairway.

Anchor means a secure point of attachment for equipment such as lifelines, lanyards, deceleration devices, and rope descent systems.

Authorized means an employee who the employer assigns to perform a specific type of duty, or allows in a specific location or area.

Cage means an enclosure mounted on the side rails of a fixed ladder or fastened to a structure behind the fixed ladder that is designed to surround the climbing space of the ladder. A cage also is called a "cage guard" or "basket guard."

Carrier means the track of a ladder safety system that consists of a flexible cable or rigid rail attached to the fixed ladder or immediately adjacent to it.

Combination ladder means a portable ladder that can be used as a stepladder, extension ladder, trestle ladder, or stairway ladder.

Designated area means a distinct portion of a walking-working surface delineated by a warning line in which employees may perform work without additional fall protection.

Dockboard means a portable or fixed device that spans a gap or compensates for a difference in elevation between a loading platform and a transport vehicle. Dockboards include, but are not limited to, bridge plates, dock plates, and dock levelers.

Equivalent means alternative designs, equipment, materials, or methods, that the employer can demonstrate will provide an equal or greater degree of safety for employees compared to the designs, equipment, materials, or methods specified in this subpart.

Extension ladder means a non-self-supporting portable ladder that is adjustable in length.

Failure means a load refusal, breakage, or separation of component parts. A load refusal is the point at which the ultimate strength of a component or object is exceeded.

Fall hazard means any condition on a walking-working surface that exposes an employee to a risk of harm from a fall on the same level or to a lower level.

Fall protection means any equipment, device, or system that prevents an employee from falling from an elevation or mitigates the effect of such a fall.

Fixed ladder means a ladder with rails or individual rungs that is permanently attached to a structure, building, or equipment. Fixed ladders include individual-rung ladders, but not ship stairs, step bolts, or manhole steps.

Grab bar means an individual horizontal or vertical handhold installed to provide access above the height of the ladder.

Guardrail system means a barrier erected along an unprotected or exposed side, edge, or other area of a walking-working surface to prevent employees from falling to a lower level.

Handrail means a rail used to provide employees with a handhold for support.

Hoist area means any elevated access opening to a walking-working surface through which equipment or materials are loaded or received.

Hole means a gap or open space in a floor, roof, horizontal walking-working surface, or similar surface that is at least 2 inches (5 cm) in its least dimension.

Individual-rung ladder means a ladder that has rungs individually attached to a building or structure. An individual-rung ladder does not include manhole steps.

Ladder means a device with rungs, steps, or cleats used to gain access to a different elevation.

Ladder safety system means a system designed to eliminate or reduce the possibility of falling from a ladder. A ladder safety system usually consists of a carrier, safety sleeve, lanyard, connectors, and body harness. Cages and wells are not ladder safety systems.
Low-slope roof means a roof that has a slope less than or equal to a ratio of 4 in 12 (vertical to horizontal).

Lower level means a surface or area to which an employee could fall. Such surfaces or areas include, but are not limited to, ground levels, floors, roofs, ramps, runways, excavations, pits, tanks, materials, water, equipment, and similar surfaces and structures, or portions thereof.

Manhole steps means steps that are individually attached to, or set into, the wall of a manhole structure.

Maximum intended load means the total load (weight and force) of all employees, equipment, vehicles, tools, materials, and other loads the employer reasonably anticipates to be applied to a walking-working surface at any one time.

Mobile means manually propelled or moveable.

Mobile ladder stand (ladder stand) means a mobile, fixed-height, self-supporting ladder that usually consists of wheels or casters on a rigid base and steps leading to a top step. A mobile ladder stand also may have handrails and is designed for use by one employee at a time.

Mobile ladder stand platform means a mobile, fixed-height, self-supporting unit having one or more standing platforms that are provided with means of access or egress.

Open risers means the gap or space between treads of stairways that do not have upright or inclined members (risers).

Opening means a gap or open space in a wall, partition, vertical walking-working surface, or similar surface that is at least 30 inches (76 cm) high and at least 18 inches (46 cm) wide, through which an employee can fall to a lower level.

Personal fall protection system means a system used to arrest an employee in a fall from a walking-working surface. It consists of a body harness, anchorage, and connector. The means of connection may include a lanyard, deceleration device, lifeline, or a suitable combination of these.

Personal fall protection system means a system (including all components) an employer uses to provide protection from falling or to safely arrest an employee's fall if it occurs. Examples of personal fall protection systems include personal fall arrest systems, positioning systems, and travel restraint systems.

Platform means a walking-working surface that is elevated above the surrounding area.

Portable ladder means a ladder that can readily be moved or carried, and usually consists of side rails joined at intervals by steps, rungs, or cleats.

Positioning system (work-positioning system) means a system of equipment and connectors that, when used with a body harness or body belt, allows an employee to be supported on an elevated vertical surface, such as a wall or window sill, and work with both hands free. Positioning systems also are called "positioning system devices" and "work-positioning equipment."

Qualified describes a person who, by possession of a recognized degree, certificate, or professional standing, or who by extensive knowledge, training, and experience has successfully demonstrated the ability to solve or resolve problems relating to the subject matter, the work, or the project.

Ramp means an inclined walking-working surface used to access another level.

Riser means the upright (vertical) or inclined member of a stair that is located at the back of a stair tread or platform and connects to the front edge of the next higher tread, platform, or landing.

Rope descent system means a suspension system that allows an employee to descend in a controlled manner and, as needed, stop at any point during the descent. A rope descent system usually consists of a roof anchor, support rope, a descent device, carabiner(s) or shackles, and a chair (seatboard). A rope descent system also is called controlled descent equipment or apparatus. Rope descent systems do not include industrial rope access systems.

Run, step, or cleat means the crosspiece of a ladder on which an employee's steps to climb up and down.

Runway means an elevated walking-working surface, such as a catwalk, a foot walk along shafting, or an elevated walkway between buildings.

Scaffold means any temporary elevated or suspended platform and its supporting structure, including anchorage points, used to support employees, equipment, materials, and other items. For purposes of this subpart, a scaffold does not include a crane-suspended or derrick-suspended personnel platform or a rope descent system.

Ship stair (ship ladder) means a stairway that is equipped with treads, stair rails, and open risers, and has a slope that is between 50 and 70 degrees from the horizontal.

Side-step ladder means a type of fixed ladder that requires an employee to step sideways from it in order to reach a walking-working surface, such as a landing.

Spiral stairs means a series of treads attached to a vertical pole in a winding fashion, usually within a cylindrical space.

Stair rail or stair rail system means a barrier installed along the exposed or open side of stairways to prevent employees from falling to a lower level.

Stairway (stairs) means risers and treads that connect one level with another, and includes any landings and platforms in between those levels.

Stairways include standard, spiral, alternating tread-type, and ship stairs.

Standard stairs means a fixed or permanently installed stairway. Ship, spiral, and alternating tread-type stairs are not considered standard stairs.

Step bolt (pole step) means a bolt or rung attached at intervals along a structural member used for foot placement and as a handhold when climbing or standing.

Step ladder means a self-supporting, portable ladder that has a fixed height, flat steps, and a hinged back.

Step stool means a self-supporting, portable ladder that has flat steps and side rails. For purposes of the final rule, step stools includes only those ladders that have a fixed height, do not have a pail shelf, and do not exceed 32 inches (81 cm) in overall height to the top cap, although side rails may extend above the top cap. A step stool is designed so an employee can climb and stand on all of the steps and the top cap.

Through ladder means a type of fixed ladder that allows the employee to step through the side rails at the top of the ladder to reach a walking-working surface, such as a landing.

Tieback means an attachment between an anchorage (e.g., structural member) and a supporting device (e.g., parapet clamp or cornice hook).

Toothboard means a low protective barrier that is designed to prevent materials, tools, and equipment from falling to a lower level, and protect employees from falling.

Travel restraint system means a combination of an anchorage, anchorage connector, lanyard (or other means of connection), and body support that an employer uses to eliminate the possibility of an employee going over the edge of a walking-working surface.

Tread means a horizontal member of a stair or stairway, but does not include landings or platforms.

Unprotected sides and edges mean any side or edge of a walking-working surface (except at entrances and other points of access) where there is no wall, guardrail system, or stair rail system to protect an employee from falling to a lower level.
Walking-working surface means any horizontal or vertical surface on or through which an employee walks, works, or gains access to a work area or workplace location.

Warning line means a barrier erected to warn employees that they are approaching an unprotected side or edge, and which designates an area in which work may take place without the use of other means of fall protection.

Wall means a permanent, complete enclosure around a fixed ladder.

§ 1910.22 General requirements.

(a) Surface conditions. The employer must ensure:

(1) All places of employment, passageways, storerooms, service rooms, and walking-working surfaces are kept in a clean, orderly, and sanitary condition.

(2) The floor of each workroom is maintained in a clean and, to the extent feasible, in a dry condition. When wet processes are used, drainage must be maintained and, to the extent feasible, dry standing places, such as false floors, platforms, and mats must be provided.

(3) Walking-working surfaces are maintained free of hazards such as sharp or protruding objects, loose boards, corrosion, leaks, spills, snow, and ice.

(b) Loads. The employer must ensure that each walking-working surface can support the maximum intended load for that surface.

(c) Access and egress. The employer must provide, and ensure each employee uses, a safe means of access and egress to and from walking-working surfaces.

(d) Inspection, maintenance, and repair. The employer must ensure:

(1) Walking-working surfaces are inspected, regularly and as necessary, and maintained in a safe condition:

(2) Hazardous conditions on walking-working surfaces are corrected or repaired before an employee uses the walking-working surface again. If the correction or repair cannot be made immediately, the hazard must be guarded to prevent employees from using the walking-working surface until the hazard is corrected or repaired; and

(3) When any correction or repair involves the structural integrity of the walking-working surface, a qualified person performs or supervises the correction or repair.

§ 1910.23 Ladders.

(a) Application. The employer must ensure that each ladder used meets the requirements of this section. This section covers all ladders, except when the ladder is:

(1) Used in emergency operations such as firefighting, rescue, and tactical law enforcement operations, or training for those operations;

(2) Designed into or as an integral part of machines or equipment;

(b) General requirements for all ladders. The employer must ensure:

(1) Ladder rungs, steps, and cleats are parallel, level, and uniformly spaced when the ladder is in position for use;

(2) Ladder rungs, steps, and cleats are spaced not less than 10 inches (25 cm) apart, measured between the centerlines of the rungs, cleats, and steps, except that:

(i) Ladder rungs and steps in elevators must be spaced not less than 6 inches (15 cm) apart and not more than 15 inches (42 cm) apart, as measured along the ladder side rails; and

(ii) Fixed ladder rungs and steps on telecommunication towers must be spaced not more than 18 inches (46 cm) apart, measured between the centerlines of the rungs or steps;

(iii) Steps on stepools are spaced not less than 8 inches (20 cm) apart and not more than 12 inches (30 cm) apart, measured between the centerlines of the steps;

(iv) Ladder rungs, steps, and cleats have a minimum clear width of 11.5 inches (29 cm) on portable ladders and 16 inches (41 cm) (measured before installation of ladder safety systems) for fixed ladders, except that:

(i) The minimum clear width does not apply to ladders with narrow rungs that are not designed to be stepped on, such as those located on the tapered end of orchard ladders and similar ladders;

(ii) Rungs and steps of manhole entry ladders that are supported by the manhole opening must have a minimum clear width of 9 inches (23 cm);

(iii) Rungs and steps on rolling ladders used in telecommunication centers must have a minimum clear width of 8 inches (20 cm); and

(iv) Stepools have a minimum clear width of 10.5 inches (26.7 cm);

(5) Wooden ladders are not coated with any material that may obscure structural defects;

(6) Metal ladders are made with corrosion-resistant material or protected against corrosion;

(7) Ladder surfaces are free of puncture and laceration hazards;

(8) Ladders are used only for the purposes for which they were designed;

(9) Ladders are inspected before initial use in each work shift, and more frequently as necessary, to identify any visible defects that could cause employee injury;

(10) Any ladder with structural or other defects is immediately tagged “Dangerous: Do Not Use” or with similar language in accordance with § 1910.145 and removed from service until repaired in accordance with § 1910.22(d), or replaced:

(i) Each employee faces the ladder when climbing up or down it;

(ii) Each employee uses at least one hand to grasp the ladder when climbing up and down it; and

(iii) No employee carries any object or load that could cause the employee to lose balance and fall while climbing up or down the ladder.

(c) Portable ladders. The employer must ensure:

(1) Rungs and steps of portable metal ladders are corrugated, knurled, dimpled, coated with skid-resistant material, or otherwise treated to minimize the possibility of slipping;

(2) Each stepladder or combination ladder used in a stepladder mode is equipped with a metal spreader or locking device that securely holds the front and back sections in an open position while the ladder is in use;

(3) Ladders are not loaded beyond the maximum intended load;

Note to paragraph (c)(3): The maximum intended load, as defined in § 1910.21(b), includes the total load (weight and force) of the employee and all tools, equipment, and materials being carried.

(4) Ladders are used only on stable and level surfaces unless they are secured or stabilized to prevent accidental displacement;

(5) No portable single rail ladders are used;

(6) No ladder is moved, shifted, or extended while an employee is on it;

(7) Ladders placed in locations such as passageways, doorways, or driveways where they can be displaced by other activities or traffic;

(i) Are secured to prevent accidental displacement; or

(ii) Are guarded by a temporary barricade, such as a row of traffic cones or caution tape, to keep the activities or traffic away from the ladder;

(8) The cap (if equipped) and top step of a stepladder are not used as steps;

(9) Portable ladders used on slippery surfaces are secured and stabilized;

(10) The top of a non-self-supporting ladder is placed so that both side rails are supported, unless the ladder is equipped with a single support attachment;

(11) Portable ladders used to gain access to an upper landing surface have side rails that extend at least 3 feet (0.9 m) above the upper landing surface (see Figure D-1 of this section);

(12) Ladders and ladder sections are not tied or fastened together to provide...
(d) **Fixed ladders.** The employer must ensure:

1. Fixed ladders are capable of supporting their maximum intended load;
2. The minimum perpendicular distance from the centerline of the steps or rungs, or grab bars, or both, to the nearest permanent object is 4.5 inches (11 cm); and
3. Grab bars do not protrude on the climbing side beyond the rungs of the ladder that they serve.
4. The side rails of through or side-step ladders extend 42 inches (1.1 m) above the top of the access level or landing platform served by the ladder. For parapet ladders, the access level is:
   i. The roof, if the parapet is cut to permit passage through the parapet; or
   ii. The top of the parapet, if the parapet is continuous;
5. For through ladders, the steps or rungs are omitted from the extensions, and the side rails are flared to provide not less than 24 inches (61 cm) and not more than 30 inches (76 cm) of clearance. When a ladder safety system is provided, the maximum clearance between side rails of the extension must not exceed 36 inches (91 cm);
6. For side-step ladders, the side rails, rungs, and steps must be continuous in the extension (see Figure D-2 of this section);
7. Grab bars extend 42 inches (1.1 m) above the access level or landing platforms served by the ladder;
8. The minimum size (cross-section) of grab bars is the same size as the rungs of the ladder;
9. When a fixed ladder terminates at a hatch (see Figure D-3 of this section), the hatch cover:
   i. Opens with sufficient clearance to provide easy access to or from the ladder; and
   ii. Opens at least 70 degrees from horizontal if the hatch is counterbalanced;
10. Individual-rung ladders are constructed to prevent the employee's feet from sliding off the ends of the rungs (see Figure D-4 of this section);
11. Fixed ladders having a pitch greater than 90 degrees from the horizontal are not used;
12. The step-across distance from the centerline of the rungs or steps is:

For through ladders, not less than 7 inches (18 cm) and not more than 12 inches (30 cm) to the nearest edge of the structure, building, or equipment accessed from the ladders;

For side-step ladders, not less than 15 inches (38 cm) and not more than 20 inches (51 cm) to the access points of the platform edge;

Fixed ladders that do not have cages or wells have:

i. A clear width of at least 15 inches (38 cm) on each side of the ladder centerline to the nearest permanent object; and
ii. A minimum perpendicular distance of 30 inches (76 cm) from the centerline of the steps or rungs to the nearest object on the climbing side. When unavoidable obstructions are encountered, the minimum clearance at the obstruction may be reduced to 24 inches (61 cm), provided deflector plates are installed (see Figure D-5 of this section).

**Note to paragraph (d):** Section 1910.28 establishes the employer's duty to provide fall protection for employees on fixed ladders, and §1910.29 specifies the criteria for fall protection systems for fixed ladders.
Figure D-2 -- Side-Step Fixed Ladder Sections

Figure D-3 -- Example of Counterbalanced Hatch Cover at Roof

Figure D-4 -- Individual Rung Ladder
Mobile ladder stands and mobile ladder stand platforms—

(i) General requirements. The employer must:

(ii) The steps and platforms of mobile ladder stands and platforms are slip resistant. Slip-resistant surfaces must be either an integral part of the design and construction of the mobile ladder stand and platform, or provided as a secondary process or operation, such as dimpling, knurling, shotblasting, coating, spraying, or applying durable slip-resistant tapes;

(iii) Mobile ladder stands and platforms are capable of supporting at least four times their maximum intended load;

(iv) Wheels or casters under load are capable of supporting their proportional share of four times the maximum intended load, plus their proportional share of the unit's weight;

(v) Unless otherwise specified in this section, mobile ladder stands and platforms with a top step height of 4 feet (1.2 m) or above have handrails with a vertical height of 29.5 inches (75 cm) to 37 inches (94 cm), measured from the front edge of a step. Removable gates or non-rigid members, such as chains, may be used instead of handrails in special-use applications;

(vi) The maximum work-surface height of mobile ladder stands and platforms does not exceed four times the shortest base dimension, without additional support. For greater heights, outriggers, counterweights, or comparable means that stabilize the mobile ladder stands and platforms and prevent overturning must be used;

(vii) Mobile ladder stands and platforms that have wheels or casters are equipped with a system to impede horizontal movement when an employee is on the stand or platform; and

(viii) No mobile ladder stand or platform moves when an employee is on it.

(2) Design requirements for mobile ladder stands. The employer must:

(i) Steps are uniformly spaced and arranged, with a rise of not more than 10 inches (25 cm) and a depth of not less than 7 inches (18 cm). The slope of the step stringer to which the steps are attached must not be more than 60 degrees, measured from the horizontal;

(ii) Mobile ladder stands with a top step height above 10 feet (3 m) have the top step protected on three sides by a handrail with a vertical height of at least 36 inches (91 cm); and top steps that are 20 inches (51 cm) or more, front to back, have a midrail and toeboard. Removable gates or non-rigid members, such as chains, may be used instead of handrails in special-use applications; and

(iii) The standing area of mobile ladder stands is within the base frame.

(3) Design requirements for mobile ladder stand platforms. The employer must ensure:

(i) Steps of mobile ladder stand platforms meet the requirements of paragraph (e)(2)(i) of this section. When the employer demonstrates that the requirement is not feasible, steeper slopes or vertical rung ladders may be used, provided the units are stabilized to prevent overturning;

(ii) Mobile ladder stand platforms with a platform height of 4 to 10 feet (1.2 m to 3 m) have, in the platform area, handrails with a vertical height of at least 36 inches (91 cm) and midrails; and

(iii) All ladder stand platforms with a platform height above 10 feet (3 m) have guardrails and toeboards on the exposed sides and ends of the platform.

(4) Removable gates or non-rigid members, such as chains, may be used on mobile ladder stand platforms instead of handrails and guardrails in special-use applications.

§1910.24 Step bolts and manhole steps.

(a) Step bolts. The employer must ensure:

(1) Each step bolt installed on or after January 17, 2017 in an environment where corrosion may occur is constructed of, or coated with, material that protects against corrosion;

(2) Each step bolt is designed, constructed, and maintained to prevent the employee's foot from slipping off the end of the step bolt;

(3) Step bolts are uniformly spaced at a vertical distance of not less than 12 inches (30 cm) and not more than 18 inches (46 cm) apart, measured center to center (see Figure D-6 of this section). The spacing from the entry and exit surface to the first step bolt may differ from the spacing between the other step bolts;

(4) Each step bolt has a minimum clear width of 4.5 inches (11 cm);

(5) The minimum perpendicular distance between the centerline of each step bolt to the nearest permanent object in back of the step bolt is 7 inches (18 cm). When the employer demonstrates that an obstruction cannot be avoided, the distance must be at least 4.5 inches (11 cm);

(6) Each step bolt installed before January 17, 2017 is capable of supporting its maximum intended load;
(7) Each step bolt installed on or after January 17, 2017 is capable of supporting at least four times its maximum intended load;

(8) Each step bolt is inspected at the start of the workshift and maintained in accordance with § 1910.22; and

(9) Any step bolt that is bent more than 15 degrees from the perpendicular in any direction is removed and replaced with a step bolt that meets the requirements of this section before an employee uses it.

(b) Manhole steps. (1) The employer must ensure that each manhole step is capable of supporting its maximum intended load.

(2) The employer must ensure that each manhole step installed on or after January 17, 2017:
   (i) Has a corrugated, knurled, dimpled, or other surface that minimizes the possibility of an employee slipping;
   (ii) Is constructed of, or coated with, material that protects against corrosion if the manhole step is located in an environment where corrosion may occur;
   (iii) Has a minimum clear step width of 10 inches (25 cm);
   (iv) Is uniformly spaced at a vertical distance not more than 16 inches (41 cm) apart, measured center to center between steps. The spacing from the entry and exit surface to the first manhole step may differ from the spacing between the other steps.
   (v) Has a minimum perpendicular distance between the centerline of the manhole step to the nearest permanent object in back of the step of at least 4.5 inches (11 cm); and
   (vi) Is designed, constructed, and maintained to prevent the employee’s foot from slipping or sliding off the end.

(3) The employer must ensure that each manhole step is inspected at the start of the workshift and maintained in accordance with § 1910.22.

§ 1910.25 Stairways.
(a) Application. This section covers all stairways (including standard, spiral, ship, and alternating tread-type stairs), except for stairs serving floating roof tanks, stairs on scaffolds, stairs designed into machines or equipment, and stairs on self-propelled motorized equipment.

(b) General requirements. The employer must ensure:
   (1) Handrails, stair rail systems, and guardrail systems are provided in accordance with § 1910.26;
   (2) Vertical clearance above any stair tread to any overhead obstruction is at least 6 feet, 8 inches (203 cm), as measured from the leading edge of the tread. Spiral stairs must meet the vertical clearance requirements in paragraph (d)(3) of this section.
   (3) Stairs have uniform riser heights and tread depths between landings;
   (4) Stairway landings and platforms are at least the width of the stair and at least 30 inches (76 cm) in depth, as measured in the direction of travel;
   (5) When a door or a gate opens directly on a stairway, a platform is provided, and the swing of the door or gate does not reduce the platform’s effective usable depth to:
   (i) Less than 20 inches (51 cm) for platforms installed before January 17, 2017; and
   (ii) Less than 22 inches (56 cm) for platforms installed on or after January 17, 2017 (see Figure D–7 of this section);
   (6) Each stair can support at least five times the normal anticipated live load, but never less than a concentrated load of 1,000 pounds (454 kg) applied at any point.
   (7) Standard stairs are used to provide access from one walking-working surface to another when operations necessitate regular and routine travel between levels, including access to operating platforms for equipment. Winding stairways may be used on tanks and similar round structures when the diameter of the tank or structure is at least 5 feet (1.5 m).
   (8) Spiral, ship, or alternating tread-type stairs are used only when the employer can demonstrate that it is not feasible to provide standard stairs.
   (9) When paragraph (b)(8) of this section allows the use of spiral, ship, or alternating tread-type stairs, they are installed, used, and maintained in accordance with manufacturer’s instructions.

Figure D-6 — Step Bolt Spacing
Figure D-7 -- Door or Gate Opening on Stairway

(c) Standard stairs. In addition to paragraph (b) of this section, the employer must ensure standard stairs:

1. Are installed at angles between 30 to 50 degrees from the horizontal;
2. Have a maximum riser height of 9.5 inches (24 cm);
3. Have a minimum tread depth of 9.5 inches (24 cm); and
4. Have a minimum width of 22 inches (56 cm) between vertical barriers (see Figure D-8 of this section).

(5) Exception to paragraphs (c)(2) and (3) of this section. The requirements of paragraphs (c)(2) and (3) do not apply to standard stairs installed prior to January 17, 2017. OSHA will deem those stairs in compliance if they meet the dimension requirements specified in Table D-1 of this section or they use a combination that achieves the angle requirements of paragraph (c)(1) of this section.

</tbody>
</table>
(d) Spiral stairs. In addition to paragraph (b) of this section, the employer must ensure spiral stairs:

1. Have a minimum clear width of 26 inches (66 cm);
2. Have a maximum riser height of 9.5 inches (24 cm);
3. Have a minimum headroom above spiral stair treads of at least 6 feet, 6 inches (2 m), measured from the leading edge of the tread;

4. Have a minimum tread depth of 7.5 inches (19 cm), measured at a point 12 inches (30 cm) from the narrower edge;
5. Have a uniform tread size;
6. Ship stairs. In addition to paragraph (b) of this section, the employer must ensure ship stairs (see Figure D-9 of this section):

1. Are installed at a slope of 50 to 70 degrees from the horizontal;
2. Have open risers with a vertical rise between tread surfaces of 6.5 to 12 inches (17 to 30 cm);
3. Have minimum tread depth of 4 inches (10 cm); and
4. Have a minimum tread width of 18 inches (46 cm).

Figure D-9 – Ship Stairs

(f) Alternating tread-type stairs. In addition to paragraph (b) of this section, the employer must ensure alternating tread-type stairs:

1. Have a series of treads installed at a slope of 50 to 70 degrees from the horizontal;
2. Have a distance between handrails of 17 to 24 inches (51 to 61 cm);
3. Have a minimum tread depth of 6.5 inches (22 cm); and
4. Have open risers if the tread depth is less than 9.5 inches (24 cm);
5. Have a minimum tread width of 7 inches (18 cm), measured at the leading edge of the tread (i.e., nosing).
§ 1910.26 Dockboards.

The employer must ensure that each dockboard used meets the requirements of this section. The employer must ensure:

(a) Dockboards are capable of supporting the maximum intended load in accordance with § 1910.22(b).

(b)(1) Dockboards put into initial service on or after January 17, 2017 are designed, constructed, and maintained to prevent transfer vehicles from running off the dockboard edge;

(2) Exception to paragraph (b)(1) of this section. When the employer demonstrates there is no hazard of transfer vehicles running off the dockboard edge, the employer may use dockboards that do not have run-off protection.

(c) Portable dockboards are secured by anchoring them in place or using equipment or devices that prevent the dockboard from moving out of a safe position. When the employer demonstrates that securing the dockboard is not feasible, the employer must ensure there is sufficient contact between the dockboard and the surface to prevent the dockboard from moving out of a safe position;

(d) Measures, such as wheel chocks or sand shoes, are used to prevent the transport vehicle (e.g., a truck, semi-trailer, trailer, or rail car) on which a dockboard is placed, from moving while employees are on the dockboard; and

(e) Portable dockboards are equipped with handholds or other means to permit safe handling of dockboards.

§ 1910.27 Scaffolds and rope descent systems.

(a) Scaffolds. Scaffolds used in general industry must meet the requirements in 29 CFR part 1926, subpart L (Scaffolds).

(b) Rope descent systems—(1) Anchorage. (i) Before any rope descent system is used, the building owner must inform the employer, in writing that the building owner has identified, tested, certified, and maintained each anchorage so it is capable of supporting at least 5,000 pounds (226 kg), in any direction, for each employee attached. The information must be based on an annual inspection by a qualified person and certification of each anchorage by a qualified person, as necessary, and at least every 10 years.

(ii) The employer must ensure that no employee uses any anchorage before the employer has obtained written information from the building owner that each anchorage meets the requirements of paragraph (b)(1)(i) of this section. The employer must keep the information for the duration of the job.

(iii) The requirements in paragraphs (b)(1)(i) and (ii) of this section must be implemented no later than November 20, 2017.
§ 1910.28 Duty to have fall protection and falling object protection.

(a) General. (1) This section requires employers to provide protection for each employee exposed to fall and falling object hazards. Unless stated otherwise, the employer must ensure that all fall protection and falling object protection required by this section meet the criteria in § 1910.29, except that personal fall protection systems required by this section meet the criteria of § 1910.146.

(b) This section does not apply:

(ii) To portable ladders;

(iii) When employers are inspecting, investigating, or assessing workplace conditions or work to be performed prior to the start of work or after all work has been completed. This exemption does not apply when fall protection systems or equipment meeting the requirements of § 1910.29 have been installed and are available for workers to use for pre-work and post-work inspections, investigations, or assessments;

(b)(3) To fall hazards presented by the exposed perimeters of entertainment stages and the exposed perimeters of rail-station platforms;

(b)(4) To powered platforms covered by § 1910.66(d);

(b)(5) To aerial lifts covered by § 1910.67(c)(2)(v); 

(b)(6) To telecommunications work covered by § 1910.268(a)(7) and (6); and

(b)(7) To electric power generation, transmission, and distribution work covered by § 1910.269(g)(2)(i).

(b)(8) Protection from fall hazards—(1) Unprotected sides and edges. (i) Except as provided elsewhere in this section, the employer must ensure that each employee on a walking-working surface with an unprotected side or edge that is 4 feet (1.2 m) or more above a lower level is protected from falling by one or more of the following:

(A) Guardrail systems;

(B) Safety net systems; or

(C) Personal fall protection systems, such as personal fall arrest, travel restraint, or positioning systems;

(b)(8)(ii) When the employer can demonstrate that it is not feasible or creates a greater hazard to use guardrail, safety net, or personal fall protection systems on residential roofs, the employer must develop and implement a fall protection plan that meets the requirements of 29 CFR 1926.502(k) and training that meets the requirements of 29 CFR 1926.506(a) and (c).

Note to paragraph (b)(8)(ii) of this section: There is a presumption that it is feasible and will not create a greater hazard to use at least one of the above-listed fall protection systems specified in paragraph (b)(1)(i) of this section. Accordingly, the employer has the burden of establishing that it is not feasible or creates a greater hazard to provide the fall protection systems specified in paragraph (b)(1)(i) and that it is necessary to implement a fall protection plan that complies with § 1926.502(k) in the particular work operation, in lieu of implementing any of those systems.

((iii) When the employer can demonstrate that the use of fall protection systems is not feasible on the working side of a platform used at a loading rack, loading dock, or teeming platform, the work may be done without a fall protection system, provided:

(A) The work operation for which fall protection is infeasible is in process;

(B) Access to the platform is limited to authorized employees; and

(C) The authorized employees are trained in accordance with § 1910.30.

(2) Hoist areas. The employer must ensure:

(i) Each employee in a hoist area is protected from falling 4 feet (1.2 m) or more to a lower level by:

(A) A guardrail system;

(B) A personal fall arrest system; or

(C) A travel restraint system;

(ii) When any portion of a guardrail system, gate, or chains is removed, and an employee must lean through or over the edge of the platform opening to facilitate hoisting, the employee is protected from falling by a personal fall arrest system;

(iii) If grab handles are installed at hoist areas, they meet the requirements of §1910.29(l).

(3) Holes. The employer must ensure:

(i) Each employee is protected from falling through any hole (including skylights) that is 4 feet (1.2 m) or more above a lower level by one or more of the following:

(A) Covers;

(B) Guardrail systems;

(C) Travel restraint systems; or

(D) Personal fall arrest systems;

(ii) Each employee is protected from tripping into or stepping into or through any hole that is less than 4 feet (1.2 m) above a lower level by covers or guardrail systems.
(iv) Each employee is protected from falling into a ladderway floor hole or ladderway platform hole by a guardrail system and toeboards erected on all exposed sides, except at the entrance to the hole, where a self-closing gate or an offset must be used.

(v) Each employee is protected from falling through a hatchway and chute floor hole by:

(A) A hinged floor-hole cover that meets the criteria in § 1910.29 and a fixed guardrail system that leaves only one notched side. When the hole is not in use, the employer must ensure the cover is closed or a removable guardrail system is provided on the exposed sides;

(B) A removable guardrail system and toeboards on not more than two sides of the hole and a fixed guardrail system on all other exposed sides. The employer must ensure the removable guardrail system is kept in place when the hole is not in use; or

(C) A guardrail system or a travel restraint system when a work operation necessitates passing material through a hatchway or chute floor hole.

(4) Dockboards. (i) The employer must ensure that each employee on a dockboard is protected from falling 4 feet (1.2 m) or more to a lower level by a guardrail system or handrails.

(ii) A guardrail system or handrails are not required when:

(A) Dockboards are being used solely for material-handling operations using motorized equipment;

(B) Employees engaged in these operations are not exposed to fall hazards greater than 10 feet (3 m); and

(C) These employees have been trained in accordance with § 1910.30.

(5) Runways and similar walkways. (i) The employer must ensure each employee on a runway or similar walkway is protected from falling 4 feet (1.2 m) or more to a lower level by a guardrail system.

(ii) When the employer can demonstrate that it is not feasible to have guardrails on both sides of a runway used exclusively for a special purpose, the employer may omit the guardrail on one side of the runway, provided the employer ensures:

(A) The runway is at least 18 inches (46 cm) wide; and

(B) Each employee is provided with and uses a personal fall arrest system or travel restraint system.

(6) Dangerous equipment. The employer must ensure:

(i) Each employee less than 4 feet (1.2 m) above dangerous equipment is protected from falling into or onto the dangerous equipment by a guardrail system or a travel restraint system, unless the equipment is covered or guarded to eliminate the hazard.

(ii) Each employee 4 feet (1.2 m) or more above dangerous equipment must be protected from falling by:

(A) Guardrail systems;

(B) Safety net systems;

(C) Travel restraint systems; or

(D) Personal fall arrest systems.

(7) Openings. The employer must ensure that each employee on a walking-working surface near an opening, including one with a chute attached, where the inside bottom edge of the opening is less than 39 inches (99 cm) above that walking-working surface and the outside bottom edge of the opening is 4 feet (1.2 m) or more above a lower level is protected from falling by the use of:

(i) Guardrail systems;

(ii) Safety net systems;

(iii) Travel restraint systems; or

(iv) Personal fall arrest systems.

(8) Repair pits, service pits, and assembly pits less than 10 feet in depth. The use of a fall protection system is not required for a repair pit, service pit, or assembly pit that is less than 10 feet (3 m) deep, provided the employer:

(i) Limits access within 6 feet (1.8 m) of the edge of the authorized employees trained in accordance with § 1910.30;

(ii) Applies floor markings at least 6 feet (1.8 m) from the edge of the pit in colors that contrast with the surrounding area; or places a warning line at least 6 feet (1.8 m) from the edge of the pit as well as stanchions that are capable of resisting, without tipping over, a force of at least 16 pounds (71 N) applied horizontally against the stanchion at a height of 30 inches (76 cm); or places a combination of floor markings and warning lines at least 6 feet (1.8 m) from the edge of the pit.

When two or more pits in a common area are not more than 15 feet (4.5 m) apart, the employer may comply by placing contrasting floor markings at least 6 feet (1.8 m) from the pit edge around the entire area of the pits; and

(iii) Posts readily visible caution signs that meet the requirements of § 1910.145 and state “Caution—Open Pit.”

(9) Fixed ladders (that extend more than 24 feet (7.3 m) above a lower level). (i) For fixed ladders that extend more than 24 feet (7.3 m) above a lower level, the employer must:

(A) Existing fixed ladders. Each fixed ladder installed before November 19, 2018 is equipped with a personal fall arrest system, ladder safety system, cage, or well;

(B) New fixed ladders. Each fixed ladder installed on and after November 19, 2018, is equipped with a personal fall arrest system or a ladder safety system;

(C) Replacement. When a fixed ladder, cage, or well, or any portion of a section thereof, is replaced, a personal fall arrest system or ladder safety system is installed in at least that section of the fixed ladder, cage, or well where the replacement is located; and

(D) Final deadline. On and after November 19, 2036, all fixed ladders are equipped with a personal fall arrest system or a ladder safety system.

(ii) When a one-section fixed ladder is equipped with a personal fall protection or a ladder safety system or a fixed ladder is equipped with a personal fall arrest or ladder safety system on more than one section, the employer must ensure:

(A) The personal fall arrest system or ladder safety system provides protection throughout the entire vertical distance of the ladder, including all ladder sections; and

(B) The ladder has rest platforms provided at maximum intervals of 150 feet (45.7 m).

(iii) The employer must ensure ladder sections having a cage or well are:

(A) Are offset from adjacent sections; and

(B) Have landing platforms provided at maximum intervals of 30 feet (9.1 m).

(iv) The employer may use a cage or well in combination with a personal fall arrest system or ladder safety system provided that the cage or well does not interfere with the operation of the system.

(10) Outdoor advertising (billboards). (i) The requirements in paragraph (b)(9) of this section, and other requirements in subparts D and I of this part, apply to fixed ladders used in outdoor advertising activities.

(ii) When an employee engaged in outdoor advertising climbs a fixed ladder before November 19, 2018 that is not equipped with a cage, well, personal fall arrest system, or a ladder safety system the employer must ensure the employee:

(A) Receives training and demonstrates the physical capability to perform the necessary climbs in accordance with § 1910.29(b);

(B) Wears a body harness equipped with an 18-inch (46 cm) rest lanyard;

(C) Keeps both hands free of tools or material when climbing on the ladder; and

(D) Is protected by a fall protection system upon reaching the work position.

(11) Stairways. The employer must ensure:

(i) Each employee exposed to an unprotected side or edge of a stairway
landing that is 4 feet (1.2 m) or more above a lower level is protected by a guardrail or stair rail system;

(ii) Each flight of stairs having at least 3 treads and at least 4 risers is equipped with stair rail systems and handrails as follows:

<table>
<thead>
<tr>
<th>Stair width</th>
<th>Enclosed</th>

<td>One stair rail system with handrail on open side, one handrail on enclosed side, and one intermediate handrail located in the middle of the stair.</td>
<td>One stair rail system with handrail on each open side and one intermediate handrail located in the middle of the stair.</td>
<td>One handrail on at least one side.</td>
</tr>
</tbody>
</table>

**Exterior stairs less than 44 inches (1.1 m).**

Note to table: The width of the stair must be clear of all obstructions except handrails.

(iii) Each ship stairs and alternating tread type stairs is equipped with handrails on both sides.

(12) **Scaffolds and rope descent systems.** The employer must ensure:

   (i) Each employee on a scaffold is protected from falling in accordance to CFR part 1926, subpart L; and

   (ii) Each employee using a rope descent system 4 feet (1.2 m) or more above a lower level is protected from falling by a personal fall arrest system.

(13) **Work on low-slope roofs.** (i) When work is performed less than 6 feet (1.6 m) from the roof edge, the employer must ensure each employee is protected from falling by a guardrail system, safety net system, travel restraint system, or personal fall arrest system.

(ii) When work is performed at least 6 feet (1.6 m) but less than 15 feet (4.6 m) from the roof edge, the employer must ensure each employee is protected from falling by using a guardrail system, safety net system, travel restraint system, or personal fall arrest system.

(iii) When work is performed 15 feet (4.6 m) or more from the roof edge, the employer must:

   (A) Protect each employee from falling by a guardrail system, safety net system, travel restraint system, or personal fall arrest system or a designated area. The employer is not required to provide any fall protection, provided the work is both infrequent and temporary; and

   (B) Implement and enforce a work rule prohibiting employees from going within 15 feet (4.6 m) of the roof edge without using fall protection in accordance with paragraphs (b) (13)(i) and (ii) of this section.

(14) **Slaughtering facility platforms.** (i) The employer must protect each employee on the unprotected working side of a slaughtering facility platform that is 4 feet (1.2 m) or more above a lower level from falling by using:

   (A) Guardrail systems; or

   (B) Travel restraint systems.

(ii) When the employer can demonstrate the use of a guardrail or travel restraint system is not feasible, the work may be done without those systems provided:

   (A) The work operation for which fall protection is infeasible is in process;

   (B) Access to the platform is limited to authorized employees; and

   (C) The authorized employees are trained in accordance with § 1910.30.

(15) **Walking-working surfaces not otherwise addressed.** Except as provided elsewhere in this section or by other subparts of this part, the employer must
ensure each employee on a walking-
working surface 4 feet (1.2 m) or more
above a lower level is protected from
falling by:
(i) Guardrail systems;
(ii) Safety net systems; or
(iii) Personal fall protection systems,
such as personal fall arrest, travel
restraint, or positioning systems.
(c) Protection from falling objects.
When an employee is exposed to falling
objects, the employer must ensure that
each employee wears head protection
that meets the requirements of subpart
I of this part. In addition, the employer
must protect employees from falling
objects by implementing one or more of
the following:
(1) Erecting toeboards, screens, or
guardrail systems to prevent objects
from falling to a lower level;
(2) Erecting canopy structures and
keeping potential falling objects far
enough from an edge, hole, or opening
to prevent them from falling to a lower
level; or
(3) Barricading the area into which
objects could fall, prohibiting
employees from entering the barricaded
area, and keeping objects far enough
from an edge or opening to prevent
them from falling to a lower level.
§ 1910.29 Fall protection systems and
falling object protection—criteria and
practices.
(a) General requirements. The
employer must:
(1) Ensure each fall protection system
and falling object protection, other than
personal fall protection systems, that
this part requires meets the
requirements in this section. The
employer must ensure each personal fall
protection system meets the
requirements in subpart I of this part;
and
(2) Provide and install all fall
protection systems and falling object
protection this subpart requires, and
comply with the other requirements in
this subpart before any employee begins
work that necessitates fall or falling
object protection.
(b) Guardrail systems. The employer
must ensure guardrail systems meet the
following requirements:
(1) The top edge height of top rails, or
equivalent guardrail system members,
are 42 inches (107 cm), plus or minus
3 inches (8 cm), above the walking-
working surface. The top edge height
may exceed 45 inches (114 cm),
provided the guardrail system meets all
other criteria of paragraph (b) of this
section (see Figure D-11 of this section).
(2) Midrails, screens, mesh,
intermediate vertical members, solid
panels, or equivalent intermediate
members are installed between the
walking-working surface and the top
edge of the guardrail system as follows
when there is not a wall or parapet that
is at least 21 inches (53 cm) high:
(i) Midrails are installed at a height
midway between the top edge of the
guardrail system and the walking-
working surface;
(ii) Screens and mesh extend from the
walking-working surface to the top rail
and along the entire opening between
top rail supports;
(iii) Intermediate vertical members
(such as balusters) are installed no more
than 19 inches (48 cm) apart; and
(iv) Other equivalent intermediate
members (such as additional midrails
and architectural panels) are installed so
that the openings are not more than 19
inches (48 cm) wide.
(3) Guardrail systems are capable of
withstanding, without failure, a force of
at least 200 pounds (890 N) applied in
a downward or outward direction
within 2 inches (5 cm) of the top edge,
at any point along the top rail.
(4) When the 200-pound (890 N) test
load is applied in a downward
direction, the top rail of the guardrail
system must not deflect to a height of
less than 38 inches (99 cm) above the
walking-working surface.
(5) Midrails, screens, mesh,
intermediate vertical members, solid
panels, and other equivalent
intermediate members are capable of
withstanding, without failure, a force of
at least 150 pounds (667 N) applied in
any downward or outward direction at
any point along the intermediate
member.
(6) Guardrail systems are smooth-
surfaced to protect employees from
injury, such as punctures or lacerations,
and to prevent catching or snagging
of clothing.
(7) The ends of top rails and midrails
do not overhang the terminal posts,
except where the overhang does not
pose a projection hazard for employees.
(8) Steel banding and plastic banding
are not used for top rails or midrails.
(9) Top rails and midrails are at least
0.25 inches (0.6 cm) in diameter or in
thickness.
(10) When guardrail systems are used
at hoist areas, a removable guardrail
section, consisting of a top rail and
midrail, are placed across the access
opening between guardrail sections
when employees are not performing
hoisting operations. The employer may
use chains or gates instead of a
removable guardrail section at hoist
areas if the employer demonstrates the
chains or gates provide a level of safety
equivalent to guardrails.
(11) When guardrail systems are used
around holes, they are installed on all
unprotected sides or edges of the hole.
(12) For guardrail systems used
around holes through which materials
may be passed:
(i) When materials are being passed
through the hole, not more than two
sides of the guardrail system are
removed; and
(ii) When materials are not being
passed through the hole, the hole must
be guarded by a guardrail system along
all unprotected sides or edges or closed
over with a cover.
(13) When guardrail systems are used
around holes that serve as points of
access (such as ladderways), the
guardrail system opening:
(i) Has a self-closing gate that slides
or swings away from the hole, and is
equipped with a top rail and midrail or
equivalent intermediate member that
meets the requirements in paragraph (b)
of this section; or
(ii) Is offset to prevent an employee
from walking or falling into the hole;
(14) Guardrail systems on ramps and
runways are installed along each
unprotected side or edge.
(15) Manila or synthetic rope used for
top rails or midrails are inspected as
necessary to ensure that the rope
continues to meet the strength
requirements in paragraphs (b)(3) and
(5) of this section.
Note to paragraph (b) of this section: The
criteria and practices requirements for
guardrail systems on scaffolds are contained
in 29 CFR part 1926, subpart L.
(c) Safety net systems. The employer must ensure that each safety net system meets the requirements in 29 CFR part 1926, subpart M.

(d) Designated areas. (1) When the employer uses a designated area, the employer must ensure:

(i) Employees remain within the designated area while work operations are underway; and

(ii) The perimeter of the designated area is delineated with a warning line consisting of a rope, wire, tape, or chain that meets the requirements of paragraphs (d)(1) and (3) of this section.

(2) The employer must ensure each warning line:

(i) Has a minimum breaking strength of 200 pounds (0.89 kN); (ii) Is installed so its lowest point, including sag, is not less than 34 inches (86 cm) and not more than 30 inches (99 cm) above the walking-working surface; (iii) Is supported in such a manner that pulling on one section of the line will not result in slack being taken up in adjacent sections causing the line to fall below the limits specified in paragraph (d)(2)(ii) of this section; (iv) Is clearly visible from a distance of 25 feet (7.6 m) away, and anywhere within the designated area; (v) Is erected as close to the work area as the task permits; and (vi) Is erected not less than 6 feet (1.8 m) from the roof edge for work that is both temporary and infrequent, or not less than 15 feet (4.6 m) for other work.

(3) When mobile mechanical equipment is used to perform work that is both temporary and infrequent in a designated area, the employer must ensure the warning line is erected not less than 6 feet (1.8 m) from the unprotected side or edge that is parallel to the direction in which the mechanical equipment is operated, and not less than 10 feet (3 m) from the unprotected side or edge that is perpendicular to the direction in which the mechanical equipment is operated.

(e) Covers. The employer must ensure each cover for a hole in a walking-working surface:

(1) Is capable of supporting without failure, at least twice the maximum intended load that may be imposed on the cover at any one time; and

(2) Is secured to prevent accidental displacement.

(f) Handrails and stair rail systems. The employer must ensure:

(i) Height criteria. (ii) Handrails are not less than 30 inches (76 cm) and not more than 38 inches (97 cm), as measured from the leading edge of the stair tread to the top surface of the handrail (see Figure D-12 of this section).

(ii) The height of stair rail systems meets the following:

(A) The height of stair rail systems installed before January 17, 2017 is not less than 30 inches (76 cm) from the leading edge of the stair tread to the top surface of the top rail; and

(B) The height of stair rail systems installed on or after January 17, 2017 is not less than 42 inches (107 cm) from the leading edge of the stair tread to the top surface of the top rail.

(iii) The top rail of a stair rail system may serve as a handrail only when:

(A) The height of the stair rail system is not less than 36 inches (91 cm) and not more than 38 inches (97 cm) as measured at the leading edge of the stair tread to the top surface of the top rail (see Figure D-13 of this section); and

(B) The top rail of the stair rail system meets the other handrail requirements in paragraph (f) of this section.

(2) Finger clearance. The minimum clearance between handrails and any other object is 2.25 inches (5.7 cm).

(3) Surfaces. Handrails and stair rail systems are smooth-surfaced to protect employees from injury, such as punctures or lacerations, and to prevent catching or snagging of clothing.

(4) Openings in stair rails. No opening in a stair rail system exceeds 19 inches (48 cm) at its least dimension.

(5) Handhold. Handrails have the shape and dimension necessary so that employees can grasp the handrail firmly.

(6) Projection hazards. The ends of handrails and stair rail systems do not present any projection hazards.

(7) Strength criteria. Handrails and the top rails of stair rail systems are capable of withstanding, without failure, a force of at least 200 pounds (890 N) applied in any downward or outward direction within 2 inches (5 cm) of any point along the top edge of the rail.

[Diagram of Guard Rail Systems]

\[\text{Figure D-11 – Guard Rail Systems}\]
(g) Cages, wells, and platforms used with fixed ladders. The employer must ensure:

(1) Cages and wells installed on fixed ladders are designed, constructed, and maintained to permit easy access to, and egress from, the ladder that they enclose (see Figures D–14 and D–15 of this section);

(2) Cages and wells are continuous throughout the length of the fixed ladder, except for access, egress, and other transfer points;

(3) Cages and wells are designed, constructed, and maintained to contain employees in the event of a fall, and to direct them to a lower landing; and

(4) Platforms used with fixed ladders provide a horizontal surface of at least 24 inches by 30 inches (61 cm by 76 cm).

Note to paragraph (g): Section 1910.28 establishes the requirements that employers must follow on the use of cages and wells as a means of fall protection.
(b) Outdoor advertising. This paragraph (b) applies only to employers engaged in outdoor advertising operations (see § 1910.28(b)(10)). Employers must ensure that each employee who climbs a fixed ladder without fall protection:
1. Is physically capable, as demonstrated through observations of actual climbing activities or by a physical examination, to perform the duties that may be assigned, including climbing fixed ladders without fall protection;
2. Has successfully completed a training or apprenticeship program that includes hands-on training on the safe climbing of ladders and is retrained as necessary to maintain the necessary skills;
3. Has the skill to climb ladders safely, as demonstrated through formal classroom training or on-the-job training, and performance observation; and
4. Performs climbing duties as a part of routine work activity.

(1) Ladder safety systems. The employer must ensure:
1. Each ladder safety system allows the employee to climb up and down using both hands and does not require that the employee continuously hold, push, or pull any part of the system while climbing;
2. The connection between the carrier or lifeline and the point of attachment to the body harness or belt does not exceed 9 inches (23 cm);
3. Mountings for rigid carriers are attached at each end of the carrier, with intermediate mountings spaced, as necessary, along the entire length of the carrier so the system has the strength to stop employee falls;
4. Mountings for flexible carriers are attached at each end of the carrier and cable guides for flexible carriers are installed at least 25 feet (7.6 m) apart but not more than 40 feet (12.2 m) apart along the entire length of the carrier;
5. The design and installation of mountings and cable guides does not reduce the design strength of the ladder; and
6. Ladder safety systems and their support systems are capable of withstanding, without failure, a drop test consisting of an 18-inch (46-cm) drop of a 500-pound (227-kg) weight.

(1) Personal fall protection systems. Body belts, harnesses, and other components used in personal fall arrest systems, work positioning systems, and travel restraint systems must meet the requirements of § 1910.140.

(k) Protection from falling objects. (1) The employers must ensure toeboards used for falling object protection:
1. Are erected along the exposed edge of the overhead walking-working surface for a length that is sufficient to protect employees below.
2. Have a minimum vertical height of 3.5 inches (9 cm) as measured from the top edge of the toeboard to the level of the walking-working surface.
3. Do not have more than a 0.25-inch (0.5-cm) clearance or opening above the walking-working surface.
(iv) Are solid or do not have any opening that exceeds 1 inch (3 cm) at its greatest dimension.
(v) Have a minimum height of 2.5 inches (6 cm) when used around vehicle repair, service, or assembly pits. Toeboards may be omitted around vehicle repair, service, or assembly pits when the employer can demonstrate that a toeboard would prevent access to a vehicle that is over the pit.
(vi) Are capable of withstanding, without failure, a force of at least 50 pounds (222 N) applied in any downward or outward direction at any point along the toeboard.
(2) The employer must ensure:
(i) Where tools, equipment, or materials are piled higher than the top of the toeboard, paneling or screening is installed from the toeboard to the midrail of the guardrail system and for a length that is sufficient to protect employees below. If the items are piled higher than the midrail, the employer also must install paneling or screening to the top rail and for a length that is sufficient to protect employees below; and
(ii) All openings in guardrail systems are small enough to prevent objects from falling through the opening.
(3) The employer must ensure canopies used for as fall protection are strong enough to prevent collapse and to prevent penetration by falling objects.
(i) Grab handles. The employer must ensure each grab handle:
(1) Is not less than 12 inches (30 cm) long;
(2) Is mounted to provide at least 3 inches (6 cm) of clearance from the framing or opening; and
(3) Is capable of withstanding a maximum horizontal pull-out force equal to two times the maximum intended load or 200 pounds (890 N), whichever is greater.
§1926.101 Training requirements.
(a) Fall hazards. (1) Before any employee is exposed to a fall hazard, the employer must provide training for each employee who uses personal fall protection systems or who is required to be trained as specified elsewhere in this part. Employers must ensure employees are trained in the requirements of this paragraph or before May 17, 2017.
(2) The employer must ensure that each employee is trained by a qualified person.
(3) The employer must train each employee in at least the following topics:
(i) The nature of the fall hazards in the work area and how to recognize them;
(ii) The procedures to be followed to minimize those hazards;
(iii) The correct procedures for installing, inspecting, operating, maintaining, and disassembling the personal fall protection systems that the employee uses; and
(iv) The requirements of personal fall protection systems and equipment specified in paragraph (a)(1) of this section, including, but not limited to, proper hook-up, anchoring, and tie-off techniques, and methods of equipment inspection and storage, as specified by the manufacturer.
(b) Equipment hazards. (1) The employer must train each employee on or before May 17, 2017, in the proper care, inspection, storage, and use of equipment covered by this part by an employer using the equipment.
(2) The employer must train each employee who uses a climbing ladder or portable equipment to properly perform and secure it to prevent unintentional movement.
(3) The employer must train each employee who uses a rope descent system in proper rigging and use of the equipment in accordance with §1910.27.
(4) The employer must train each employee who uses a designated area in the proper set-up and use of the area.
(c) Retraining. The employer must retrain an employee when the employer has reason to believe the employee does not have the understanding and skill required by paragraphs (a) and (b) of this section. Situations requiring retraining include, but are not limited to, the following:
(1) When changes in the workplace render previous training obsolete or inadequate;
(2) When changes in the types of fall protection systems or equipment or over previous training obsolete or inadequate; or
(3) When inadequacies in an employee's knowledge or use of fall protection systems or equipment indicate that the employee no longer has the requisite understanding or skill necessary to use equipment or perform the job safely.
(d) Training must be understandable. The employer must provide information and training to each employee in a manner that the employee understands.

Subpart F—[Amended]

4. Revise the authority citation for subpart F to read as follows:

Authority: 29 U.S.C. 653, 655, and 657; Secretary of Labor's Order No. 2–71 (36 FR 7773), 5–76 (41 FR 30059), 9–83 (48 FR 35736), 1–90 (55 FR 9093), 5–2007 (72 FR 31159), or 1–2012 (77 FR 3912), as applicable; and 29 CFR part 1911.

§1910.66 Powered platforms for building maintenance.

* * *

§1910.66 Powered platforms for building maintenance.

* * *

(a) General (1) Permanent installations in existence and/or completed before July 23, 1990 shall comply with paragraphs (b) and (c) and appendix C to subpart I of this part.

(b) * * *

(2) * * *

(i) Permanent installations in existence and/or completed before July 23, 1990 shall comply with paragraphs (g), (h), (i), and appendix C to subpart I of this part.

(c) * * *

(3) Building owners of all installations, new and existing, shall inform the employer in writing that the installation has been inspected, tested, and maintained in compliance with the requirements of paragraphs (g) and (h) of this section and that all anchors meet the requirements of §1910.140(c)(15).

* * *

§1910.140 Horizontal lifelines and personal fall arrest systems.

* * *

§1910.140 Horizontal lifelines and personal fall arrest systems.

* * *

(a) General. (1) The platform shall be provided with a secondary wire rope suspension system if the platform contains overhead structures which restrict the emergency egress of employees. A horizontal lifeline or a direct connection anchorage shall be provided as part of a personal fall arrest system that meets the requirements of subpart I of this part for each employee on such a platform.

(M) A vertical lifeline shall be provided as part of a personal fall arrest system that meets the requirements of subpart I of this part for each employee on a working platform suspended by two or more wire ropes. If the failure of one wire rope or suspension attachment will cause the platform to upset. If a secondary wire rope suspension is used, vertical lifelines are not required for the personal fall arrest system, provided that each employee is attached to a horizontal lifeline anchored to the platform.

* * *

(3) Each point single suspended working platform shall be provided with a secondary wire rope suspension system which will prevent the working platform from falling should there be a failure of the primary means of support, or if the platform contains overhead structures which restrict the egress of
the employees. A horizontal life line or a direct connection anchorage shall be provided as part of a personal fall arrest system that meets the requirements of subpart I of this part for each employee on the platform.

(i) Personal fall protection. Employees on working platforms shall be protected by a personal fall arrest system meeting the requirements of subpart I of this part and as otherwise provided by this standard.

* * * * *

Appendix C to § 1910.66 [Reserved]

Appendix D to § 1910.66—Existing Installations (Mandatory)

(c) Access to the roof car. Safe access to the roof car and from the roof car to the working platform shall be provided. If the access to the roof car at any point of its travel is not over the roof area or where otherwise necessary for safety, then self-closing, self-locking gates shall be provided. Access to and from roof cars must comply with the requirements of subpart D of this part.

* * * * *

§ 1910.67 Vehicle-mounted elevating and rotating work platforms.

* * * * *

(c) * * *

(2) * * *

(v) A personal fall arrest or travel restraint system that meets the requirements in subpart I of this part shall be worn and attached to the boom or basket when working from an aerial lift.

* * * * *

§ 1910.68 Manlifts.

* * * * *

(b) * * *

(ii) Construction. The rules shall be standard guardrails with toeboards that meet the requirements in subpart D of this part.

* * * * *

(12) Emergency exit ladder. A fixed metal ladder accessible from both the "up" and "down" run of the manlift shall be provided for the entire travel of the manlift. Such ladders shall meet the requirements in subpart D of this part.

* * * * *

Subpart I—[Amended]

8. Revise the authority citation for subpart I to read as follows:

9. In §1910.132, revise paragraph (g) to read as follows:

§ 1910.132 General requirements.

* * * * *

(g) Paragraphs (d) and (f) of this section apply only to §§1910.133, 1910.135, 1910.136, 1910.138, and 1910.140. Paragraphs (d) and (f) of this section do not apply to §§1910.134 and 1910.137.

* * * * *

§ 1910.139 [Added and Reserved]

10. Add reserved §1910.139.

11. Add §1910.140 to read as follows:

§ 1910.140 Personal fall protection systems.

(a) Scope and application. This section establishes performance, care, and use criteria for all personal fall protection systems. The employer must ensure that each personal fall protection system used to comply with this part must meet the requirements of this section.

(b) Definitions. The following definitions apply to this section:

Anchor means a secure point of attachment for equipment such as lifelines, lanyards, or deceleration devices.

Belt terminal means an end attachment of a window cleaner’s positioning system used for securing the belt or harness to a window cleaner’s belt anchor.

Body belt means a strap with means both for securing about the waist and for attaching to other components such as a lanyard used with positioning systems, travel restraint systems, or ladder safety systems.

Body harness means straps that secure about the employee in a manner to distribute the fall arrest forces over at least the thighs, pelvis, waist, chest, and shoulders, with a means for attaching the harness to other components of a personal fall protection system.

Camber means a connector generally comprised of a trapezoidal or oval shaped body with a closed gate or similar arrangement that may be opened to attach another object and, when released, automatically closes to retain the object.

Competent person means a person who is capable of identifying existing and predictable hazards in any personal fall protection system or any component of it, as well as in their application and uses with related equipment, and who has authorization to take prompt, corrective action to eliminate the identified hazards.

Connector means a device used to couple (connect) parts of the fall protection system together.

D-ring means a connector used:

(i) In a harness as an integral attachment element or fall arrest attachment;

(ii) In a lanyard, energy absorber, lifeline, or anchorage connector as an integral connector; or

(iii) In a positioning or travel restraint system as an attachment element.

Deceleration device means any mechanism that serves to dissipate energy during a fall.

Deceleration distance means the vertical distance a falling employee travels from the point at which the deceleration device begins to operate, excluding lifeline elongation and free fall distance, until stopping. It is measured as the distance between the location of an employee’s body harness attachment point at the moment of activation (at the onset of fall arrest forces) of the deceleration device during a fall, and the location of that attachment point after the employee comes to a full stop.

Equivalent means alternative designs, equipment, materials, or methods that the employer can demonstrate will provide an equal or greater degree of safety for employees compared to the designs, equipment, materials, or methods specified in the standard.

Free fall means the act of falling before the personal fall arrest system begins to apply force to arrest the fall.

Free fall distance means the vertical displacement of the fall arrest attachment point on the employee’s body belt or body harness between onset of the fall and just before the system begins to apply force to arrest the fall. This distance excludes deceleration distance, lifeline and lanyard elongation, but includes any deceleration device slide distance or self-retracting lifeline/lanyard extension before the device operates and fall arrest forces occur.

Lanyard means a flexible line of rope, wire rope, or strap that generally has a connector at each end for connecting the body belt or body harness to a deceleration device, lifeline, or anchorage.

Lifeline means a component of a personal fall protection system consisting of a flexible line for connection to an anchorage at one end so as to hang vertically (vertical
life line), or for connection to anchorages at both ends so as to stretch horizontally (horizontal life line), and serves as a means for connecting other components of the system to the anchorage.

**Personal fall arrest system** means a system used to arrest an employee in a fall from a walking-working surface. It consists of a body harness, anchorage, and connector. The means of connection may include a lanyard, deceleration device, lifeline, or a suitable combination of these.

**Personal fall protection system** means a system (including all components) an employer uses to provide protection from falling or to safely arrest an employee's fall if one occurs.

Examples of personal fall protection systems include personal fall arrest systems, positioning systems, and travel restraint systems.

**Positioning system** (work-positioning system) means a system of equipment and connectors that, when used with a body harness or body belt, allows an employee to be supported on an elevated vertical surface, such as a wall or window sill, and work with both hands free. Positioning systems also are called "positioning system devices" and "work-positioning equipment."

**Qualified** describes a person who, by possession of a recognized degree, certificate, or professional standing, or who by extensive knowledge, training, and experience has successfully demonstrated the ability to solve or resolve problems relating to the subject matter, the work, or the project.

**Rope grab** means a deactivation device that travels on a lifeline and automatically, by friction, engages the lifeline and locks so as to arrest the fall of an employee. A rope grab usually employs the principle of inertial locking, cam/lever locking, or both.

**Safety factor** means the ratio of the design load and the ultimate strength of the material.

**Self-retracting lifeline/lanyard** means a deactivation device containing a drum-wound line that can be slowly extracted from, or retracted onto, the drum under slight tension during normal movement by the employee. At the onset of a fall, the device automatically locks the drum and arrests the fall.

**Snap hook** means a connector comprised of a hook-shaped body with a normally closed gate, or similar arrangement that may be manually opened to permit the hook to receive an object. When released, the snap hook automatically closes to retain the object. Opening a snap hook requires two separate actions. Snap hooks are generally one of two types:

(i) **Automatic-locking type (permitted)** with a self-closing and self-locking gate that remains closed and locked until intentionally unlocked and opened for connection or disconnection; and

(ii) **Non-locking type (prohibited)** with a self-closing gate that remains closed, but not locked, until intentionally opened for connection or disconnection.

**Travel restraint system** means a rope or wire rope used to transfer forces from a body support to an anchorage or anchorage connector in a travel restraint system.

**Travel restraint system** means a combination of an anchorage, anchorage connector, lanyard (or other means of connection), and body support that an employer uses to eliminate the possibility of an employee going over the edge of a walking-working surface. A window cleaner's belt means a positioning belt that consists of a waist belt, an integral shoulder strap, and a skirt.

**Window cleaner's belt anchor** (window anchor) means specifically designed fall-preventing attachment points permanently affixed to a window frame or to a building part immediately adjacent to the window frame, for direct attachment of the terminal portion of a window cleaner's belt.

**Window cleaner's positioning system** means a system which consists of a window cleaner's belt secured to window anchors.

**Work-positioning system** (see Positioning system in this paragraph (b)).

(c) **General requirements.** The employer must ensure that personal fall protection systems meet the following requirements. Additional requirements for personal fall arrest systems and positioning systems are contained in paragraphs (d) and (e) of this section, respectively.

1. Connectors must be drop forged, pressed or formed steel, or made of equivalent materials.
2. Connectors must have a corrosion-resistant finish, and all surfaces and edges must be smooth to prevent damage to interfacing parts of the system.
3. When vertical lifelines are used, each employee must be attached to a separate lifeline.
4. Lanyards and vertical lifelines must have a minimum breaking strength of 5,000 pounds (22.2 kN).
5. Self-retracting lifelines and lanyards that automatically limit free fall distance to 2 feet (0.61 m) or less must have components capable of sustaining a minimum tensile load of 3,000 pounds (13.3 kN) applied to the device with the lifeline or lanyard in the fully extended position.
6. A competent person or qualified person must inspect each knot in a lanyard or vertical lifeline to ensure that it meets the requirements of paragraphs (c)(4) and (5) of this section before any employee uses the lanyard or lifeline.
7. D-rings, snap hooks, and carabiners must be capable of sustaining a minimum tensile load of 5,000 pounds (22.2 kN).
8. D-rings, snap hooks, and carabiners must be proof tested to a minimum tensile load of 5,000 pounds (16 kN) without cracking, breaking, or incurring permanent deformation. The gate strength of snap hooks and carabiners, must be proof tested to 3,600 lbs. (16 kN) in all directions.
9. Snap hooks and carabiners must be the automatic locking type that require at least two separate, consecutive movements to open.
10. Snap hooks and carabiners must not be connected to any of the following unless they are designed for such connections:
   (i) Directly to webbing, rope, or wire rope;
   (ii) To each other;
   (iii) To a D-ring to which another snap hook, carabiner, or connector is attached;
   (iv) To a horizontal life line; or
   (v) To any object that is incompatibly shaped or dimensioned in relation to the snap hook or carabiner such that unintentional disengagement could occur when the connected object depresses the snap hook or carabiner gate, allowing the components to separate.
11. The employer must ensure that each horizontal lifeline:
   (i) Is designed, installed, and used under the supervision of a qualified person; and
   (ii) Is part of a complete personal fall arrest system that maintains a safety factor of at least two.
12. Anchors used to attach to personal fall protection equipment must be independent of any anchorage used to suspend employees or platforms on which employees work. Anchors used to attach to personal fall protection equipment on mobile work platforms on powered industrial trucks must be attached to an overhead member of the platform, at a point located above and near the center of the platform.
13. Anchors, except window cleaners' belt anchors covered by paragraph (e) of this section, must be:
   (i) Capable of supporting at least 5,000 pounds (22.2 kN) for each employee attached; or
   (ii) Designed, installed, and used, under the supervision of qualified
person, as part of a complete personal fall protection system that maintains a safety factor of at least two.

(14) Travel restraint lines must be capable of sustaining a tensile load of at least 5,000 pounds (22.2 kN).

(15) Lifelines must not be made of natural fiber rope. Polypropylene rope must contain an ultraviolet (UV) light inhibitor.

(16) Personal fall protection systems and their components must be used exclusively for employee fall protection and not for any other purpose, such as hoisting equipment or materials.

(17) A personal fall protection system or its components subjected to impact loading must be removed from service immediately and not used again until a competent person inspects the system or components and determines that it is not damaged and safe for use for employee personal fall protection.

(18) Personal fall protection systems must be inspected before initial use and periodically thereafter for wear, damage, and other deterioration, and defective components must be removed from service.

(19) Ropes, belts, lanyards, and harnesses used for personal fall protection must be compatible with all connectors used.

(20) Ropes, belts, lanyards, lifelines, and harnesses used for personal fall protection must be protected from being cut, abraded, melted, or otherwise damaged.

(21) The employer must provide for prompt rescue of each employee in the event of a fall.

(22) Personal fall protection systems must be worn with the attachment point of the body harness located in the center of the employee’s back near shoulder level. The attachment point may be located in the pre-sternal position if the free fall distance is limited to 2 feet (0.6 m) or less.

(23) Personal fall arrest systems—(1) System performance criteria. In addition to the general requirements in paragraph (c) of this section, the employer must ensure that personal fall arrest systems:

(i) Limit the maximum arresting force on the employee to 1,800 pounds (8 kN);

(ii) Bring the employee to a complete stop and limit the maximum deceleration distance the employee travels to 3.5 feet (1.1 m);

(iii) Have sufficient strength to withstand twice the potential impact energy of the employee free falling a distance of 6 feet (1.8 m), or the free fall distance permitted by the system; and

(iv) Sustain the employee within the system/strap configuration without making contact with the employee’s neck and chin area.

(v) If the personal fall arrest system meets the criteria and protocols in appendix D of this subpart, and is being used by an employee having a combined body and tool weight of less than 310 pounds (140 kg), the system is considered to be in compliance with the provisions of paragraphs (d)(3)(ii) must through (ii)(i) of this section. If the system is used by an employee having a combined body and tool weight of 310 pounds (140 kg) or more and the employer has appropriately modified the criteria and protocols in appendix D, then the system will be deemed to be in compliance with the requirements of paragraphs (d)(3)(i) through (ii)(i).

(2) System use criteria. The employer must ensure that:

(i) On any horizontal lifeline that may become a vertical lifeline, the device used to connect to the horizontal lifeline is capable of locking in both directions on the lifeline.

(ii) Personal fall arrest systems are rigged in such a manner that the employee cannot free fall more than 6 feet (1.8 m) or contact a lower level. A free fall may be more than 6 feet (1.8 m) provided the employer can demonstrate the manufacturer designed the system to allow a free fall of more than 6 feet and tested the system to ensure a maximum arresting force of 1,800 pounds (8 kN) is not exceeded.

(iii) Body belts. Body belts are prohibited as part of a personal fall arrest system.

(f) Positioning systems—(1) System performance requirements. The employer must ensure that each positioning system meets the following requirements:

(i) General. All positioning systems, except window cleaners’ positioning systems, are capable of withstanding, without failure, a drop test consisting of a 4-foot (1.2 m) drop of a 250-pound (113-kg) weight;

(ii) Window cleaners’ positioning systems. All window cleaners’ positioning systems must:

(A) Be capable of withstanding without failure a drop test consisting of a 6-foot (1.8 m) drop of a 250-pound (113-kg) weight; and

(B) Limit the initial arresting force on the falling employee to not more than 2,000 pounds (8.9 kN), with a duration not exceeding 2 milliseconds and any subsequent arresting forces to not more than 1,000 pounds (4.5 kN).

(iii) Positioning systems, including window cleaners’ positioning systems, that meet the test methods and procedures in appendix D of this subpart are considered to be in compliance with paragraphs (g)(1)(i) and (ii).

(iv) Lineman’s body belt and pole strap systems. Lineman’s body belt and pole strap systems must meet the following tests:

(A) A dielectric test of 810.7 volts, AC, per centimeter (25,000 volts per foot) for 3 minutes without visible deterioration;

(B) A leakage test of 98.4 volts, AC, per centimeter (3,000 volts per foot) with a leakage current of no more than 1 mA; and

(C) A flammability test in accordance with Table 1-7 of this section.

(2) System use criteria for window cleaners’ positioning systems. The employer must ensure that window
cleaners’ positioning systems meet and are used in accordance with the following:

(i) Window cleaners’ belts are designed and constructed so that:
   (A) Belt terminals will not pass through their fastenings on the belt or harness if a terminal comes loose from the window anchor; and
   (B) The length of the runner from terminal tip to terminal tip is 8 feet (2.44 m) or less;
   (ii) Window anchors to which belts are fastened are installed in the side frames or mullions of the window at a point not less than 42 inches (106.7 cm) and not more than 51 inches (129.5 cm) above the window sill;
   (iii) Each window anchor is capable of supporting a minimum load of 6,000 pounds (26.5 kN);
   (iv) Use of installed window anchors for any purpose other than attaching the window cleaner’s belt is prohibited;
   (v) A window anchor that has damaged or deteriorated fastenings or supports is removed, or the window anchor head is detached so the anchor cannot be used;
   (vi) Rope that has wear or deterioration that affects its strength is not used;
   (vii) Both terminals of the window cleaner’s belt are attached to separate window anchors during any cleaning operation;
   (viii) No employee works on a window sill or ledge on which there is snow, ice, or any other slippery condition, or on one that is weakened or rotted;
   (ix) No employee works on a window sill or ledge unless:
      (A) The window sill or ledge is a minimum of 4 inches (10 cm) wide and slopes no more than 15 degrees below horizontal; or
      (B) The 4-inch minimum width of the window sill or ledge is increased 0.4 inches (1 cm) for every degree the sill or ledge slopes beyond 15 degrees, up to a maximum of 30 degrees;
   (x) The employee attaches at least one belt terminal to a window anchor before climbing through the window opening and keeps at least one terminal attached until completely back inside the window opening;
   (xi) Except as provided in paragraph (e)(2)(xii) of this section, the employee travels from one window to another by returning inside the window opening and repeating the belt terminal attachment procedure at each window in accordance with paragraph (e)(2)(x) of this section;
   (xii) An employee using a window cleaner’s positioning system may travel from one window to another while outside of the building, provided:
   (A) At least one belt terminal is attached to a window anchor at all times;
   (B) The distance between window anchors does not exceed 4 feet (1.2 m) horizontally. The distance between windows may be increased up to 6 feet (1.8 m) horizontally if the window sill or ledge is at least 1 foot (0.31 m) wide and the slope is less than 5 degrees;
   (C) The sill or ledge between windows is continuous; and
   (D) The width of the window sill or ledge in front of the mullions is at least 6 inches (15.2 cm) wide.

12. Add appendices C and D to subpart I of part 1910 to read as follows:

Appendix C to Subpart I of Part 1910—Personal Fall Protection Systems Non-Mandatory Guidelines

The following information generally applies to all personal fall protection systems and is intended to assist employers and employees comply with the requirements of §1910.140 for personal fall protection systems.

(a) Planning considerations. It is important for employers to plan prior to using personal fall protection systems. Probably the most overlooked component of planning is locating suitable anchorage points. Such planning should ideally be done before the structure or building is constructed so that anchorage points can be used later for window cleaning or other building maintenance.

(b) Selection and use considerations. (1) The kind of personal fall protection system
selected should be appropriate for the employee’s specific work situation. Fall free distances should always be kept to a minimum. Many systems are designed for particular work applications, such as climbing ladders and poles; maintaining and servicing equipment; and window cleaning. Consideration should be given to the environment in which the work will be performed. For example, the presence of acids, dirt, moisture, oil, grease, or other substances, and their potential effects on the system selected, should be evaluated. The employer must fully evaluate the work conditions and environment (including seasonal weather changes) before selecting the appropriate personal fall protection system. Hot or cold environments may also affect fall protection systems. Wire rope should not be used where electrical hazards are anticipated. As required by § 1910.145(c)(21), the employer must provide a means for promptly rescuing an employee who should fall occur.

(2) Where lanyards, connectors, and lifelines are subject to damage by work operations, such as welding, chemical cleaning, and sandblasting, the component should be protected, or other securing systems should be used. A program for cleaning and maintaining the system may be necessary.

(c) Testing considerations. Before purchasing a personal fall protection system, an employer should insist that the supplier provide information about its test performance (using recognized test methods) or the system will not meet the minimum requirements for light use. Appendix D to this subpart contains test methods which are recommended for evaluating the performance of any system. There are some circumstances in which an employer can evaluate a system based on data and calculations derived from the testing of similar systems. Enough information must be available for the employer to demonstrate that its system and the tested system(s) are equivalent in both function and design.

(d) Component compatibility considerations. Ideally, a personal fall protection system should be designed, tested, and supplied as a complete system. However, it is common practice for lanyards, connectors, lifelines, deceleration devices, body belts, and body harnesses to be interchanged since some components wear out before others. Employers and employees should realize that all components are interchangeable. For instance, a lanyard should not be connected to a body harness and a deceleration device of the self-retracting type (unless specifically allowed by the manufacturer) since this can result in additional free fall for which the system was not designed. In addition, positioning components, such as chain, ladder hooks and rings, should not be used in personal fall arrest systems unless they meet the appropriate strength and performance requirements of Part 1910 (e.g., §§ 1910.140, 1910.265 and 1910.269). Any substitution or change to a personal fall protection system should be fully evaluated or tested by a competent person to determine that it meets applicable OSHA standards before the modified system is put in use. Also, OSHA suggests that rope be used according to manufacturers’ recommendations, especially if polypropylene rope is used.

(e) Employee training considerations. As required by §§ 1910.130 and 1910.132, before an employee uses a fall protection system, the employer must ensure that he or she is trained in the proper use of the system. This may include the following: the limits of the system; proper anchoring and tie-off techniques; estimating free fall distance, including determining elongation and deceleration distance; methods of use; and inspection and storage. Careless or improper use of fall protection equipment can result in serious injury or death. Employers and employees should become familiar with the safety features of their equipment. As well as manufacturers’ recommendations, before a fall system is used. It is important for employees to be aware that certain tie-offs (such as using knots and tying around sharp edges) can reduce the overall strength of a system. Employees also need to know the maximum permitted free fall distance. Training should stress the importance of inspections prior to use, the limitations of the equipment to be used, and unique conditions at the worksite that may be important.

(f) Instruction considerations. Employers must ensure that comprehensive instructions are provided to the supplier or qualified person as to the system’s proper use and application, including, where applicable:

1. The force measured during the sample force test;
2. The maximum elongation measured for lanyards during the force test;
3. The deceleration distance measured for deceleration devices during the force test; and
4. Caution statements on critical use limitations;
5. Limits of the system;
6. Proper hook-up, anchoring and tie-off techniques, including the proper D-ring or other attachment point to use on the body harness;
7. Proper climbing techniques;
8. Methods of inspection, use, cleaning, and storage; and
9. Specific lifelines that may be used.

(g) Inspection considerations. Personal fall protection systems must be inspected before and initial use in each worksite. Any component with damage, such as a cut, tear, abrasion, mold, or evidence of undue stretching, an alteration or addition that might affect its effectiveness, damage due to deterioration, fire, acid, or other corrosive damage, distorted hooks or faulty hook springs, or other imperfections should be removed from service immediately and, if possible, be replaced. Components used on the job site should be used in the proper manner and with due care, and should be removed from service when damaged or worn. Any personal fall protection system, including components, subjected to impact testing must be removed from service immediately and, if possible, be replaced. Components used on the job site should be used in the proper manner and with due care, and should be removed from service when damaged or worn.

(h) Rescue considerations. As required by § 1910.145(c)(21), when personal fall arrest systems are used, special consideration must be given to rescue an employee promptly should a fall occur. The availability of rescue personnel, ladders, or other rescue equipment needs to be evaluated since there may be instances in which employees cannot be rescued (e.g., employees unconscious or seriously injured). In some situations, equipment allowing employees to rescue themselves after the fall has been arrested may be desirable, such as devices that have descent capability.

(i) Tie-off considerations. Employers and employees should at all times be aware that the strength of a personal fall arrest system is based on its being attached to an anchoring system that can support the system. Therefore, if a means of attachment is used that will reduce the strength of the system (such as an eye-bolt/snaphook anchorage), that component should be replaced by a stronger one that will also maintain the appropriate maximum deceleration characteristics. The following is a listing of some situations in which employees and employers should be especially cautious:

1. Tie-off using a knot in the lanyard or linelife (at any location). The strength of the system can be reduced by 50 percent or more if a knot is used. Therefore, a stronger lanyard or linelife should be used to compensate for the knot, or the length length should be reduced (or the tie-off location raised in order to minimize free fall distance, or the lanyard or linelife should be replaced by one which has an appropriately incorporated connector to eliminate the need for a knot.

2. Tie-off around rough or sharp edges (e.g., "H" or "I" beams) or edges. Sharp or rough surfaces can damage rope lengths and this reduces the strength of the system drastically. Such tie-offs should be avoided whenever possible. An alternate means should be used such as a snap-hook/D-ring connection, a tie-off apparatus (steel cable tie-off), an effective padding of the surfaces, or an abrasion-resistant strap around the supporting member. If these alternative means of tie-off are not available, the employer should try to minimize the potential free fall distance.

3. Knots. Sliding hitch knots should not be used except in emergency situations. The one-and-one half or sliding hitch knot should never be used because it is unreliable in stopping a fall. The two-and-two, or three-and-three knots (preferable) may be used in emergency situations; however, care should be taken to limit fall distances because of reduced lifeline/layard strength. OSHA requires that a competent or qualified person inspect each knot in a lanyard or vertical lifeline to ensure it meets the strength requirements in § 1910.140.

4. Horizontal lifelines. Horizontal lifelines, depending on their geometry and angle of sag, may be subject to greater loads than the impact load imposed by an attached component. With the angle of horizontal lifeline sag is less than 30 degrees, the impact force imparted to the lifeline by an attached lanyard is greatly amplified. For example, with a sag angle of 15 degrees the force amplification rate is about 2.1, and at 5 degrees sag it is about 6/1. Depending on the angle of sag, and the lifeline’s elasticity, the strength
of the horizontal lifeline, and the anchorages to which it is attached should be increased a number of times over that of the lanyard. Extreme care should be taken in considering a horizontal lifeline for multiple tie-offs. If there are more tie-offs to a horizontal lifeline, and one employee falls, the movement of the falling employees and the horizontal lifeline down and up, and the arrest of the fall may cause other employees to fall. Horizontal lifeline anchorage strength should be increased for each additional employee to be tied-off. For these and other reasons, the systems using horizontal lifelines must be designed only by qualified persons. OSHA recommends testing incident lifelines and anchors prior to use. OSHA requires that horizontal lifelines are designed, installed and used under the supervision of a qualified person.

(k) Eye-bolts. It must be recognized that the strength of an eye-bolt is rated along the axis of the bolt, and that its strength is greatly reduced if the force is applied at a right angles to this axis (in the direction of the shear strength). Care should also be exercised in selecting the diameter of the eye-avoid creating a roll-out hazard (accidental disengagement of the snap hook from the eye).

(l) Vertical lifeline considerations. As required by § 1910.140(c)(3), each employee must have a separate lifeline when the lifeline is vertical. If multiple tie-offs to a single anchor point are used, and one employee falls, the movement of the lifeline during the arrest of the fall may pull other employees' lanyards, causing them to fall as well.

(n) Snap hook and carabiner considerations. As required by § 1910.140(c)(10), the following connections must be made unless the locking mechanism of the snap hook or carabiner has been designed for them because they are conditions that can result in failure:

(1) Direct connection to webbing, rope, or a horizontal lifeline;
(2) Two (or more) snap hooks or carabiners connected to one D-ring;
(3) Two snap hooks or carabiners connected to each other;
(4) Snap hook or carabiner connected directly to webbing, rope, or wire reaper; and
(5) Improper dimensions of the D-ring, rebar, or other connection point in relation to the snap hook or carabiner dimensions which would allow the gate to be depressed by a turning motion.

(u) Free fall considerations. Employers and employees should always be aware that a system's maximum arresting force is evaluated under normal use conditions established by the manufacturer. OSHA requires that personal fall arrest systems be rigged so an employee cannot fall free in excess of 6 feet (1.8 m). Even a few additional feet of free fall can significantly increase the arresting force on the employee, possibly to the point of causing injury and possibly exceeding the strength of the system. Because of this, the free fall distance should be kept to a minimum, and, as required by § 1910.140(d)(2), must be no greater than 6 feet (1.8 m). To assure this, the tie-off attachment point to the lifeline or anchor should be located at or above the connection point of the fall arrest equipment to the harness. Otherwise, additional free fall distance is added to the length of the connecting means (i.e., lanyard). Tying off to the walking-working surface will often result in a free fall greater than 6 feet (1.8 m). For instance, if a 6-foot (1.8-m) lanyard is used, the total free fall distance will be the distance from the walking-working level to the harness connection plus the 6 feet (1.8 m) of lanyard.

(1) Elongation and deceleration distance considerations. During fall arrest, a lanyard will stretch or elongate, whereas activation of a deceleration device will result in a certain stopping distance. These distances should be increased by the factor 1.5, if significant if the lanyard or deceleration device is attached near or at the end of a long lifeline, which may itself add considerable distance due to the body harness of the user. As required by § 1910.140(d)(2), sufficient distance to allow for all of these factors also be maintained between the user and the anchorages below, to prevent an injury due in addition to the system free arrest of the fall. In addition, a minimum of 12 feet (3.7 m) of lanyard should be allowed below the securing point of a rope-grab-type deceleration device, and the end terminated to prevent the device from sliding off the lanyard. Alternatively, the lanyard should extend to the ground or the next working level below. These measures are suggested to prevent unnecessary additional free fall after the end of the lifeline and having the rope grab become disengaged from the lifeline.

(p) Obstruction considerations. In selecting a location for tie-off, employers and employees should consider obstructions in the potential fall path of the employee. Tie-offs that minimize the possibilities of obstruction should be considered.

Appendix D to Subpart I of Part 1910—Test Methods and Procedures for Personal Fall Protection Systems Non-Mandatory Guidelines

This appendix contains test methods for personal fall protection systems which may be used to determine if they meet the system performance criteria specified in paragraphs (d) and (e) of § 1910.140.

(a) General. The following sets forth test procedures for personal fall arrest systems as defined in paragraph (d) of § 1910.140.

(b) General test conditions.

(1) Lifelines, lanyards and deceleration devices should be attached to an anchorage and connected to the harness in the same manner as they would be when used to protect employees.

(2) The anchorage should be rigid, and should not have a deflection greater than 0.04 inches (1 mm) when a force of 2,250 pounds (10 kN) is applied.

(3) The frequency response of the load measuring instrumentation should be 120 Hz.

(4) The test weight used in the strength and force tests shall be a rigid, metal cylindrical or torso-shaped object with a girth of 38 inches plus or minus 4 inches (96 cm plus or minus 10 cm).

(5) The lanyard or lifeline used to create the free fall distance should be supplied with the system, or in the absence, the least elastic lanyard or lifeline available should be used with the system.

(6) The test weight for each test should be hoisted to the required level and should be quickly released without having any appreciable motion imparted to it. The system's performance should be evaluated, taking into account the range of environmental conditions for which it is designed to be used.

(7) Following the test, the system need not be capable of further operation.

(c) Strength test.

(1) During the testing of all systems, a test weight of 300 pounds plus or minus 3 pounds (136.4 kg plus or minus 1.4 kg) should be used. [See paragraph (b)(4) of this appendix.]

(2) The test consists of dropping the test weight once. A new unused system should be used for each test.

(3) For lanyard systems, the lanyard length should be 6 feet plus or minus 2 inches (1.83 m plus or minus 5 cm) as measured from the fixed anchor to the anchorage on the body harness.

(4) For rope-grab-type deceleration devices, the length of the lifeline above the centerline of the grab is measured from the anchorage to the anchorage point on the body harness. The test weight should fall without interference, obstruction, or hitting the floor or ground during the test. In some cases a non-elastic wire lanyard of sufficient length may need to be added to the system for test purposes to create the necessary free fall distance.

(5) For lanyard systems, with systems with deceleration devices which do not automatically limit free fall distance to 2 feet (0.61 m) or less, and for systems with deceleration devices which have a connection distance in excess of 1 foot (0.3 m) [measured between the centerline of the lifeline and the anchorage point] the test weight should be raised to free fall a distance of 7.5 feet (2.3 m) from a point that is 1.5 feet (46 cm) above the anchorage point, to a point 6 feet (1.83 m) below the anchorage. The test weight should fall without interference, obstruction, or hitting the floor or ground during the test. In some cases a non-elastic wire lanyard of sufficient length may need to be added to the system for test purposes to create the necessary free fall distance.

(6) For deceleration device systems with integral lifelines or lanyards that automatically limit free fall distance to 2 feet (0.61 m) or less, the test weight should be added to free fall a distance of 4 feet (1.22 m).

(7) Any weight that detaches from the harness should constitute failure for the strength test.

(d) Force test.

(1) General. The test consists of dropping the respective test weight specified in paragraph (d)(2)(i) or (d)(3)(i) of this appendix once. A new, unused system should be used for each test.

(2) For lanyard systems. (a) A test weight of 220 pounds plus or minus three pounds (100 kg plus or minus 1.8 kg) should be used. [See paragraph (b)(4) of this appendix.]
(ii) Lanyard length should be 6 feet plus or minus 2 inches (1.83 m plus or minus 5 cm) as measured from the fixed anchorage to the attachment on the body harness.

(3) The test weight is equal to the total of 6 feet (1.83 m) free fall distance without interference, obstruction, or hitting the floor or ground during the test.

(3) For all other systems, (i) A test weight of 220 pounds plus or minus 2 pounds (100 kg plus or minus 1 kg) should be used. See paragraph (b)(4) of this appendix.

(ii) The free fall distance to be used in the test should be the maximum full fall distance physically permitted by the system during normal use conditions, up to a maximum free fall distance for the test weight of 6 feet (1.83 m), except as follows:

(A) For deceleration systems having a connection link or lanyard, the test weight should fall free and at a distance equal to the connection distance (measured between the centerline of the lifeline and the attachment point to the body harness).

(B) For deceleration devices with integral lifelines or lanyards automatically limit free fall distance to 2 feet (0.61 m) or less, the test weight should fall free a distance equal to that permitted by the system in normal use. (For example, to test a system with a self-retracting lifeline or lanyard, the test weight should be supported and the system allowed to retract the lifeline or lanyard as it would in normal use. The test weight would then be released and the force and deceleration distance measured).

(4) Failure. A system fails the force test when the recorded maximum arresting force exceeds 5,200 pounds (11.2 kN) when using a body harness.

(5) Distances. The maximum elongation and deceleration distance should be recorded during the force test.

(c) Deceleration device tests.

(1) General. The device should be evaluated or tested under the environmental conditions (such as rain, ice, grease, dirt, and type of lifeline) for which the device is designed.

(2) Rope-grab-type deceleration devices. (i) Devices should be moved on a lifeline 1,000 times over the same length of line at a distance of not less than 1 foot (30.5 cm), and the mechanism should lock each time.

(ii) Unless the device is permanently marked to indicate the type of lifelines that must be used, several types (different diameters and different materials) of lifelines should be used to test the device.

(3) Other self-activating-type deceleration devices. The locking mechanisms of other self-activating-type deceleration devices designed for more than one arrest should lock each of 1,000 times as they would in normal service.

Test methods for positioning systems (paragraph (e) of §1910.140).

(e) General. The following sets forth test procedures for positioning systems as defined in paragraph (e) of §1910.140. The requirements in this appendix for personal fall arrest systems set forth procedures that may be used, along with the procedures listed below, to determine compliance with the requirements for positioning systems.

(b) Test conditions.

(1) The fixed anchorage should be rigid and should not have a deflection greater than 0.04 inches (1 mm) when a force of 2,250 pounds (10 kN) is applied.

(2) For window cleaners’ belts, the complete belt should withstand a drop test consisting of a 250-pound (113 kg) weight falling free for a distance of 6 feet (1.83 m) without a cut or tear in the belt for 6 feet (1.83 m).

The weight should be a rigid object with a height of 38 inches plus or minus 4 inches (96 cm plus or minus 10 cm) and the weight should be placed in the waistband with the belt buckle drawn firmly against the weight, as when the belt is worn by a window cleaner. One belt terminal should be attached to a rigid anchor and the other terminal should hang free. The terminals should be adjusted to their maximum span. The weight fastened in the freely suspended belt should then be lifted exactly 6 feet (1.83 m) above its “at rest” position and released so as to permit a free fall of 6 feet (1.83 m) vertically below the point of attachment of the anchor.

(3) The system should be equipped with devices and instrumentation capable of measuring the duration and magnitude of the arrest forces. Failure of the test should consist of any breakage or slippage sufficient to permit the weight to fall free of the system.

(4) All other positioning systems (except for restraint line systems) should withstand a drop test consisting of a 250-pound (113 kg) weight falling from a fall distance of 4 feet (1.2 m). The weight must be a rigid object with a height of 38 inches plus or minus 4 inches (96 cm plus or minus 10 cm). The weight should be fixed to the system in the manner that the system would be connected in normal use. The weight should be lifted exactly 4 feet (1.2 m) above its “at rest” position and released so as to permit a vertical free fall of 4 feet (1.2 m). Failure of the system should be indicated by any breakage or slippage sufficient to permit the weight to fall free of the ground.

Subpart N—[Amended]

13. Revise the authority citation for subpart N to read as follows:

Authority: 29 U.S.C. 653, 655, 657; Secretary of Labor’s Order No. 12-71 (36 FR 8754), 8-76 (41 FR 25689), 9-83 (48 FR 35736), 1-90 (55 FR 9003), 6-96 (62 FR 111), 5-2007 (72 FR 31159), 4-2010 (75 FR 55355), or 1-2012 (77 FR 3912), as applicable; and 29 CFR part 1911.

14. In §1910.261, revise paragraphs (c)(13)(i) and (k)(15) to read as follows:

§1910.261 Pulps, paper, and paperboard mills.

(c) * * *

(iii) Where conveyors cross passageways or roadways, a horizontal platform shall be provided under the conveyor, extending out from the sides of the conveyor a distance equal to ½ times the length of the wood handled.

The platform shall extend the width of the road plus 2 feet (61 cm) on each side, and shall be kept free of wood and rubbish. The edges of the platform shall be provided with toeboards or other protection that meet the requirements of subpart D of this part, to prevent wood from falling.

(d) * * *

(4) Runway to the jack ladder. The runway from the pond or unloading dock to the table shall be protected with standard handrails and toeboards. Inclined portions shall have cleats or equivalent nonslip surfaces that
complies with subpart D of this part. Protective equipment shall be provided for persons working over water.

(ii) The worker shall be provided with eye protection, a supplied air respirator, and a personal fall protection system that meets the requirements of subpart I of this part, during inspection, repairs or maintenance of acid towers. The line shall be extended to an attendant stationed outside the tower opening.

(iii) Blow-pit openings preferably shall be placed on the side of the pit instead of on the top. Openings shall be as small as possible when located on top, and shall be protected in accordance with subpart D of this part.

(b) Bleaching engines. Bleaching engines, except the Bellmor type, shall be completely covered on the top, with the exception of one small opening large enough to allow filling, but too small to admit an employee. Platforms leading from one engine to another shall have standard guardrails that meet the requirements in subpart D of this part.

(i) When beaters are fed from the floor above, the chute opening, if less than 42 inches (1.06 m) from the floor, shall be provided with a guardrail system that meets the requirements in subpart D of this part, or other equivalent enclosures. Openings for manual feeding shall be sufficient only for entry of stock, and shall be provided with at least two permanently secured crossarms or other fall protection systems that meet the requirements in subpart D.

(k) Steps. Steps of uniform rise and tread with non-slip surfaces that meet the requirements in subpart D of this part shall be provided at each press.

(iii) A guardrail that complies with subpart D of this part shall be provided at each hole.

(13) Steps. Steps or ladders that comply with subpart D of this part and tread with non-slip surfaces shall be provided at each calendar stack. Handrails and hand grips complying with subpart D shall be provided at each calendar stack.

18. In §1910.282, revise paragraph (c) to read as follows:

§1910.262 Textiles.

(e) Gray and white bins. On new installations guardrails that comply with subpart D of this part shall be provided where workers are required to climb by hand from the bin so as to protect the worker from falling to a lower level.

19. In §1910.265, revise paragraphs (c)(4)(i) and (f)(6) to read as follows:

§1910.265 Sawmills.

(iv) Elevated platforms. Where elevated platforms are used routinely on a daily basis, they shall be equipped with stairways or fixed ladders that comply with subpart D of this part.

(i) Construction. Stairways shall be constructed in accordance with subpart D of this part.

(f) Ladders. A fixed ladder complying with the requirements of subpart D of this part, or other adequate means, shall be provided to permit access to the roof. Where controls and machinery are mounted on the roof, a permanent stairway with standard handrail shall be installed in accordance with the requirements in subpart D.

20. In §1910.268:

a. Revise paragraphs (g)(1):

(b) Remove paragraph (g)(2);

(c) Redesignate (g)(3) as (g)(2),

(d) Revise paragraph (h).

The revisions read as follows:

§1910.268 Telecommunications.

(g) Personal climbing equipment—(1) General. A positioning system or a personal fall arrest system shall be provided and the employer shall ensure their use when work is performed at positions more than 4 feet (1.2 m) above the ground, on poles, and on towers, except as provided in paragraphs (a)(7) and (8) of this section. These systems shall meet the applicable requirements in subpart I of this part. The employer shall ensure that all climbing equipment is inspected before each day's use to determine that it is in safe working condition.

(b) Ladders. Ladders, step bolts, and manhole steps shall meet the applicable requirements in subpart D of this part.

21. In §1910.269, revise paragraphs (g)(2)(I), (g)(3)(IV)(B), and (g)(2)(IV)(C)(I) to read as follows:

§1910.269 Electric power generation, transmission, and distribution.

(g) (I) Personal fall arrest systems shall meet the requirements of subpart I of this part.

(II) Personal fall arrest systems shall be used in accordance with subpart I of this part.

Note to paragraph (g)(2)(IV)(B): Fall protection equipment rigged to arrest falls is considered a fall arrest system and must meet the applicable requirements for the design and use of those systems. Fall protection equipment rigged for work positioning is considered work-positioning equipment and must meet the applicable requirements for the design and use of that equipment.

(C) (1) Each employee working from an aerial lift shall use a travel restraint system or a personal fall arrest system.
