

1 Draft Minutes  
2 Scientific Advisory Committee  
3 Subcommittee on CE Protocols  
4 August 10, 2009  
5 Department of Forensic Science, Classroom 1  
6

7 Subcommittee Members Present  
8

9 Dr. Norah Rudin, chair  
10 Dr. Dan Krane  
11 Dr. John Butler  
12

13 Virginia Department of Forensic Science (“DFS”) Staff Present  
14

15 Mr. Brad Jenkins (Program Manager, Forensic Biology)  
16 Ms. Elizabeth Ballard (Forensic Scientist, Senior)  
17 Dr. Susan Greenspoon (Forensic Molecular Biologist)  
18 Dr. Katie Hall (Forensic Laboratory Specialist VI)  
19 Dr. Dave Barron (Director of Technical Services)  
20

21 Individuals Present at Some Point During the Meeting

22 Dr. Dale Carpenter (Scientific Advisory Committee)  
23 Mr. Peter Marone (DFS Director)  
24

25 Call to Order  
26

27 Dr. Norah Rudin, subcommittee chair, called the meeting to order at approximately  
28 9:35am.  
29

30 New Business  
31

32 The subcommittee adopted the agenda for the meeting.  
33

34 Issues that qualify as a “clear public danger” or “specific accreditation violation”  
35

36 Discussion ensued that these might be better interpreted as critical issues, as “clear public  
37 danger” was difficult to discern. Dr. Krane indicated three areas for discussion that may  
38 fall under this heading: limit of detection (“LOD”), mixture interpretation, and stutter.  
39 Dr. Butler had none. Dr. Rudin discussed the need to have enough negative control or  
40 reagent blank. Each issue was discussed in detail.  
41

42 LOD

43 Dr. Krane expressed a desire that LOD be determined on a run-by-run basis. Dr.  
44 Butler questioned the feasibility of doing so. Mr. Jenkins made it clear that the  
45 DFS approach to LOD followed from the method approved by the Scientific  
46 Advisory Committee (“SAC”) Y-STR subcommittee for use with

1 electropherogram data. Discussion ensued regarding the most appropriate  
2 estimation of LOD based on the maximum observed noise (2x maximum noise vs.  
3 3x maximum noise). Discussion ensued regarding how often the LOD will be  
4 reevaluated by DFS. Dr. Butler indicated that annual review is plenty, but  
5 certainly when the laser is replaced.  
6

7 Mixture Assessment/Major-Minor

8 Heterozygous Peak Balance validation summary: Committee members agreed  
9 that data for sample 11 at CSF1PO should not be utilized for statistical analyses,  
10 as it exhibits a known triallelic pattern at this locus. Mr. Jenkins agreed to do so.  
11 Questions were raised regarding Sample 1 at vWA and the use of the modified  
12 internal lane standard. All committee members agreed that data from the  
13 statewide performance checks should be mined to demonstrate the effect of the  
14 new ILS on the peak height ratios reported in the validation summary. Dr. Krane  
15 suggested that, rather than the minimum observed, the average, standard  
16 deviation, and 95% confidence interval should be reported in the protocol (to  
17 replace current Table 3 under 8.2.4. of the draft protocol). Dr. Rudin questioned  
18 if scatterplots of any lower amounts of DNA input should be included in the  
19 summary.  
20

21 Major/Minor Assessment: Dr. Greenspoon discussed approaches used by other  
22 laboratories. Dr. Butler indicated that the DFS result follows the German Stain  
23 Commission report. Dr. Krane expressed concern regarding applying statistics to  
24 a minor profile (see 8.2.7.7.4 of the draft manual). Mr. Jenkins assured the  
25 subcommittee that this would be a rare occurrence and the determination would  
26 be done in the "blind" portion of the analysis. The committee was satisfied with  
27 the response by Mr. Jenkins. Dr. Krane would like to see such clarification in the  
28 text at that location in the manual.  
29

30 Re: Further discussion ensued regarding the 33.5% cutoff for determining  
31 major/minor contributors. Discussion was largely tabled until after lunch, when  
32 the data could be examined. Dr. Krane made several suggestions to clarify the  
33 text of the Major/Minor Assessment validation summary regarding samples. Dr.  
34 Rudin suggested that, in the future, DFS may wish to consider further analysis  
35 using samples with less 1 ng total DNA.  
36

37 The committee took a mid-morning break.  
38 Meeting resumed at approximately 10:37am by Dr. Rudin.  
39

40 Further discussion ensued regarding the major/minor determination and DNA  
41 mixtures. No resolution to the cutoff percentage was made at this time, but was  
42 deferred until afternoon when a review of the data could be completed.  
43

44 Subcommittee members discussed 8.2.7.7.7 of the draft version of the manual in  
45 regards to mixtures. Drs. Krane and Rudin asked questions in regards to the  
46 wording in this section including: allelic dropout, rare alleles, and majority. Mr.

1 Jenkins clarified the intent of the protocol. Dr. Rudin suggested DFS may wish to  
2 consider revising this wording. Mr. Jenkins agreed that he would clarify the  
3 wording of the paragraph. Dr. Rudin expressed concern regarding the use of “at  
4 at least four callable loci”. Dr. Greenspoon indicated that a study was completed at  
5 the request of a previous committee which resulted in this policy. Dr. Krane  
6 suggested revising the cutoff based on the statistics, not based on the number of  
7 loci. Drs. Krane and Rudin suggest a review of data in regards to this issue. Dr.  
8 Rudin also expressed a problem with reporting inconclusive results *with reference*  
9 *to* reference profiles and suggested alternative wording. Dr. Greenspoon clarified  
10 the current report wording, which Drs. Rudin and Butler believe is good.

11  
12 Discussion ensued regarding the laboratory’s training of analysts for this  
13 transition to CE. Dr. Rudin asked Dr. Carpenter to add the training update to  
14 tomorrow’s Scientific Advisory Committee meeting agenda.

15  
16 *Other issues*

17 Samples

18 Dr. Rudin was concerned about the location of samples on the injection plate.  
19 Ms. Ballard clarified the plate loading format for automated sample processing,  
20 regarding maintaining the plate format from extraction through injection on the  
21 CE. Dr. Rudin was satisfied with that approach, but requested clarification in the  
22 protocol, especially in regard to manual setups.

23  
24 Number of contributors

25 Dr. Krane discussed section 8.2.3 of the draft manual in regards to the ability to  
26 determine the number of contributors in a mixture. Mr. Jenkins agreed to add  
27 clarification to the manual at this location that indicates peak heights and number  
28 of alleles are taken into account when determining the number of contributors to a  
29 mixture.

30  
31 Section 8.2.2 of the draft manual was raised by Dr. Krane but discussion was  
32 tabled until later.

33  
34 Workflow

35 Dr. Rudin requested clarification regarding documentation in the casefile  
36 regarding blindedness of analysis. Mr. Jenkins and Ms. Ballard clarified. Dr.  
37 Rudin indicated that DFS may consider time-stamping notes.

38  
39 Stutter

40 Dr. Krane suggested that section 8.2.7.4.2 (last sentence) be clarified. He  
41 indicated the lack of correspondence between Table 4 of the protocol and Table 1  
42 of the Stutter validation summary. Dr. Krane suggested that conventional  
43 rounding be utilized.

44  
45 The committee took a break for lunch at approximately 11:35am.  
46 Meeting resumed at approximately 12:20pm by Dr. Rudin.

1  
2 Dr. Rudin asked the committee members for any issues that must be changed before  
3 implementation. Dr. Krane suggested that Table 4 (8.2.7.4.2 of draft protocol) must be  
4 concordant with the validation summary.

5  
6 Discussion turned to more minor issues.

7  
8 Suggestions for “Optimization”

9  
10 Dr. Krane gave comments on the validation summaries:

11  
12 *Concordance*

13 It was suggested that the DFS data using non-expired reagents be used. DFS will do so.

14  
15 *Sensitivity*

16 Discussion ensued regarding the reporting of a range for optimal signal. There was  
17 disagreement among subcommittee members.

18  
19 *Precision*

20 Dr. Krane asked if DFS was intending to redo the precision study when new versions of  
21 GeneMapper ID (“GMID”) software are adopted. Mr. Jenkins indicated that this was a  
22 requirement of ISO accreditation. Dr. Krane suggested listing the version number of  
23 GMID here and elsewhere. Minor additional edits to the summary were discussed.

24  
25 *Major/Minor Assessment*

26 Discussion ensued regarding distinguishing a minor contributor from stutter. Dr. Butler  
27 referred to the International Society for Forensic Genetics recommendation #6<sup>1</sup> where  
28 peaks in the stutter position must be included in the CPE/CPI calculation if the stutter  
29 peaks and minor alleles are of similar height. Drs. Butler and Rudin agreed that this was  
30 not a “show-stopper”. Wording changes were suggested in this regard.

31  
32 *Heterozygote Peak Height Ratio*

33 Specific data were requested for review at the next break (Samples 1, 5, and 11)  
34 regarding potential binding site mutations. It was agreed that Sample 11 would be  
35 discarded at CSF1PO (or an asterisk added) explaining the known tri-allelic pattern at  
36 that locus. Additional minor revisions were requested.

37  
38 *Statewide Performance Check*

39 The GeneMapper ID version (3.2.1) should be indicated. Discussion ensued regarding  
40 optimal signal reported as 0.31 ng – 1.25 ng template DNA. Dr. Krane would prefer  
41 0.62 ng. DFS should ensure that all instances of this optimal range are consistent  
42 (protocols, validation summaries, etc.)

43  
44 *Environmental Samples*

---

<sup>1</sup> *Forensic Science International* 160(2006): 90-101.

1 Dr. Krane requested wording changes and clarification in a few instances. Discussion  
2 ensued regarding the allelic dropout observed in all three room temperature samples. Dr.  
3 Greenspoon indicated that the samples are going to be recreated for future use due to the  
4 low amount of remaining material. Dr. Krane indicated he has devised a means of  
5 calculating the slope of the “ski slope” if DFS wishes to use it.  
6

#### 7 *Non-Probative Casework*

8 It was indicated that the lowest input amount demonstrated here was 0.65ng total DNA.  
9 If DFS wishes to utilize an optimal range of 0.31 – 1.25ng, additional non-probative  
10 samples would need to be run.  
11

#### 12 *Limit of Detection (cont.)*

13 Dr. Krane again indicated his preference would be for run-specific LODs. Mr. Jenkins  
14 indicated he did not foresee DFS doing so, but revisiting the LODs on a yearly basis,  
15 perhaps. Dr. Krane then suggested DFS consider allowing calculation of the LOD on a  
16 run-by-run basis if indicated.  
17

#### 18 *Stutter*

19 Drs. Rudin and Krane agree that conventional rounding should be utilized. Edits were  
20 suggested to Tables 1 and 2. It was indicated that the protocol should be edited to reflect  
21 the need to evaluate n-(2 repeat) and n+(1 repeat) stutter. Dr. Greenspoon indicated that  
22 an additional table would be added to the protocol.  
23

#### 24 *Mixtures*

25 Typographical errors were indicated and removal of the phrase “and the origin of the  
26 cutoff value” suggested.  
27

28 The subcommittee took a break to review data.

29 Meeting resumed by Dr. Rudin.  
30

#### 31 *Limit of Detection (cont.)*

32 Drs. Rudin and Krane agreed that the blue and green data appears appropriate. The  
33 247 bp peak that defined the maximal noise in the yellow channel will be revisited by  
34 DFS, as it is now known to be an artifactual peak . It was understood that minor changes  
35 to the data may occur.  
36

#### 37 *Peak Height Ratio (cont.)*

38 Dr. Rudin indicated that sample 5 at FGA could be a binding site mutation. DFS could  
39 choose to omit this from the statistics as an outlier or keep it as a representation of the  
40 population. Dr. Krane indicated that the lower bound was not established by these data  
41 points. Dr. Krane indicated that Sample 1 at vWA looked okay.  
42

#### 43 *Optimal Injection Parameters*

44 Dr. Rudin indicated that the LOD must be revisited if longer injection times or increased  
45 amplification product are used. Dr. Rudin suggested run-specific LODs or run-specific  
46 LODs for these (non-default) injections. Dr. Butler suggested that noise is expected to

1 stay the same for increased injection times, but the stochastic threshold would be  
2 expected to increase. Dr. Butler suggested analysis of the data. If it is determined that  
3 the noise didn't change, then no more study would be needed in this regard.  
4

#### 5 Suggestions for "Optimization" of Protocols

##### 6 *Amplification*

7 Clarification and rewording was suggested in several locations. Ensure consistency in  
8 target DNA range with validation summaries.  
9

##### 10 *Capillary Electrophoresis*

11 The version of GMID used should be indicated. Sections 2.7.4, 2.7.4.4, and 2.8.2.3.7 of  
12 the draft manual were discussed earlier today. Citations for several figures were  
13 suggested by Dr. Butler.  
14

##### 15 *Analysis of Capillary Electrophoretic Data*

16 DFS was asked to provide the Appendix referred to in 7.3.7.3.1 of the draft manual. Mr.  
17 Jenkins did so. DFS was asked to clarify what would necessitate adjusting the red LOD  
18 referred to in 7.3.7.3.1 of the draft manual. DFS was asked to clarify section 7.3.9.4.1.3  
19 of the draft manual. Ms. Ballard did so. Dr. Krane suggested alternative wording to  
20 consider. Dr. Krane requested a definition of "called alleles" in 7.3.9.4.4 of the draft  
21 manual. Dr. Rudin suggested DFS think about whether anything needs to be done with  
22 peaks in the negative control below the threshold. Dr. Krane requested clarification in  
23 the protocol regarding remaking the positive control. It was clarified that the intent of  
24 the wording was to allow for reparing the injection cocktail. Dr. Rudin requested  
25 clarification in the manual regarding printing of evidentiary *and reference* samples for the  
26 case file.  
27

##### 28 *Interpretation of PowerPlex® 16 PCR Amplification Results*

29 Wording changes were suggested and typographical errors noted. Dr. Butler indicated  
30 that more specific chromosome location data are available in a March 2006 *Journal of*  
31 *Forensic Science* article. Regarding section 8.2.4, Dr. Rudin suggested a list of factors  
32 taken into account when determining the number of contributors to a mixture be  
33 delineated in the protocol here. Mr. Jenkins indicated he would take that suggestion into  
34 consideration. Dr. Krane asked that Table 3 be replaced by Table 3 from the  
35 Heterozygous Peak Balance validation summary. Mr. Jenkins indicated that he will give  
36 that consideration. Dr. Rudin requested clarification of "careful consideration" in section  
37 8.2.7.4 of the draft manual. Mr. Jenkins listed common factors to take into account. Dr.  
38 Rudin suggested defining these in the protocol. Dr. Krane suggested that section 4.2.5.4  
39 of the Databank draft manual is better and the two should be consistent. Similarly, Dr.  
40 Rudin suggested listing factors to evaluate in the protocol to aid in distinguishing  
41 between stutter and a minor allele. It was suggested to update Table 4 for scientific  
42 rounding, ensuring consistency between the protocol and the validation summary. As  
43 indicated previously, the up-stutter table was also suggested to be added here. Refer to  
44 previous discussion regarding several sections in this chapter of the protocol. Dr. Rudin  
45 suggested less vague wording for 8.2.12 regarding the reagent blank.  
46

1  
2 The subcommittee took a mid-afternoon break.  
3 Meeting resumed by Dr. Rudin at approximately 3:45pm.  
4

5 *Interpretation of PowerPlex® 16 PCR Amplification Results (cont.)*

6 Discussion ensued regarding the reporting inconclusive results at a single locus. Mr.  
7 Jenkins clarified current protocol. Varying opinions were discussed regarding the two-  
8 tiered approach by DFS. Dr. Rudin suggested another approach. Mr. Jenkins agreed to  
9 think about the other approaches discussed.

10  
11 Discussion ensued regarding the need for a QA person to review the protocol. Dr. Krane  
12 indicated that an external review could be sought, as there is not yet a replacement for  
13 Ms. Deborah Friedman. Dr. Carpenter suggested the QA persons in his laboratory  
14 system have DNA backgrounds and may be available.

15  
16 Dr. Carpenter requested that Director Marone join the meeting to clarify DFS position  
17 regarding provisional vs. non-provisional approval.  
18

19 Discussion returned to Section 8 of the draft manual (Interpretation of the PowerPlex 16  
20 PCR Amplification Results). Section 8.2.14 was discussed. Clarification was requested  
21 regarding section 8.3, in particular the next to last sentence. It was suggested that Figure  
22 6 be utilized to describe the intent. In the Figure 6 example, it was suggested that the  
23 phrase “may not be solely from the victim” be used (see D16S539 and D8S1179) so as  
24 not to suggest unintended bias.  
25

26 Director Marone arrived.  
27

28 Dr. Carpenter requested clarification of the position of DFS regarding provisional and  
29 actual approval. Director Marone indicated that approval or disapproval should be  
30 rendered, as provisional approval would be analogous to disapproval in terms of DFS  
31 going online with this technology. Dr. Rudin indicated that she foresees no problem with  
32 databank approval. Other options were explored such as phone-in meetings, etc. Dr.  
33 Butler indicated that no “deal breakers” were found by the committee. Dr. Rudin  
34 suggested compiling a list of 3-5 major issues and obtaining DFS comment on those  
35 issues. Dr. Krane suggested that numerous small issues were discussed which, in total,  
36 could be construed as “deal breakers”. Dr. Carpenter reminded the subcommittee that  
37 this negotiation has been done in good faith. Approval could be given with the  
38 understanding that the SAC would be shown documentation regarding the changes made.  
39

40 The main issues were compiled by the subcommittee to include:

- 41 1. LOD. Use maximum noise x 2 instead of maximum noise x 3 to estimate LOD.  
42 Mr. Jenkins agreed to do so.
- 43 2. Heterozygous Peak Balance – discussion ensued regarding 33.5% vs. 33% vs.  
44 “approximately”. Mr. Jenkins indicated that DFS can use 33%.
- 45 3. Four callable loci – Dr. Rudin was happy with DFS thinking about the issue. Mr.  
46 Jenkins noted that DFS would review the data and reiterated that any change

1 would go back on a previous committee recommendation. Dr. Krane suggested  
2 that the current wording could be approved tomorrow, but that the issue should be  
3 revisited in January with a presentation by DFS.

- 4 4. Stochastic Threshold – Dr. Butler indicated that the SWGDAM recommendations  
5 should come out in January and are expected to include advocating a stochastic  
6 threshold. The committee suggested DFS reconsider this point in six months.  
7 5. Interpretation of Reagent Blanks – Dr. Rudin was okay with putting this issue on  
8 the agenda for discussion in January. Mr. Jenkins suggested DFS adopt the more  
9 stringent guideline of reamplifying/reextracting as needed. Further thought will  
10 be required in situations where the reagent blank or sample is limited. Dr. Rudin  
11 suggested revisiting the topic in January if a better option is found.

12  
13 All concur that the protocol should be recommended for approval with these main issues  
14 as suggested improvements. Dr. Rudin suggested seeking a QA person’s comments by  
15 the January meeting as well.

16  
17 Dr. Rudin will prepare a draft report for the Scientific Advisory Committee tomorrow.  
18 Dr. Krane would like it to be known that a very careful evaluation has been completed.

19  
20 Public Comment

21 No public comment.

22  
23 The meeting was officially adjourned at approximately 4:45pm.
